Syn. 5. *Beat, Overpower, Overwhelm, Defeat, Discomfit, Rout, Overthrow, conquer.* *Beat* is a general, somewhat indefinite, but vigorous word, covering the others. *Overpower* and *overwhelm* are the least creditable to the one that loses in the struggle; *overpower* is least permanent in its effects. To *overpower* is to overcome by superiority of strength or numbers, but the disadvantage may be changed by the arrival of reinforcements.

To *overwhelm* is to bear down utterly, to sweep clear away by superior strength. *Defeat* is to overcome or get the better of in some kind of contest, and implies less discredit, but generally greater disaster, to the defeated party than *beat*: as, that army is considered *beaten* which withdraws from the field. *Defeat* implies a serious disadvantage, because it applies more often to large numbers engaged. *Discomfit* has fallen into comparative disuse, except in its secondary sense of foiling, etc.; in that it expresses a comparatively complete and mortifying defeat. *Rout* is to defeat and drive off the field in confusion. *Overthrow* is the most decisive and final of these words; it naturally applies only to great persons, concerns, armies, etc. See *conquer*.

There's a lean fellow *beats* all conquerors.

The first two are sometimes confounded, especially in the adverbial form, and they often cover essentially the same idea. He spoke *definitely*—that is, with his meaning sharply defined; he answered *definitively*—that is, so as to define or decide with certainty. *Definite* is passive, *definitive* active.

This depends upon the freedom of the lens from spherical and chromatic aberration.

The day was clear, and every mound and peak traced its outline with perfect definition against the sky. *O. W. Holmes*, *Old Vol. of Life*, p. 255.

Of course, every one who is in the habit of using a telescope in the daytime is familiar with the fact, that on many seemingly cloudless days there is an otherwise invisible kind of haze, which impairs or destroys *definition*, and that the best or brightest vision is obtained in the blue sky visible between large, floating annuli. *Science*, IV. 94.

2. The act of stating the signification of a word or phrase, or the essential properties of a thing.

Definition is so closely connected with classification that, until the nature of the latter process is in some measure understood, the former cannot be discussed to much purpose. *J. S. Mill*, *Logic*, I. viii. § 1.

Enthusiastically attached to the name of liberty, these historians troubled themselves little about its *definition*. *Macaulay*, *History*.

3. A statement of the signification of a word or phrase, or of what is essential to the conception of any given thing; an explanation of how any given kind is distinguished from all other kinds. Three conceptions of the nature of definition have prevailed at different times: (1) Aristotle taught that every strict definition consists of two parts, different in kind, one declaring the genus or higher class to which the species defined belongs, the other declaring the specific difference by which the given species differs from others of the same genus. This view influences most of the definitions of systematic botany and zoology. (2) The theory of logical extension and comprehension, coming into vogue

on the overthrow of Aristotelianism and attaining its extreme development in the formal logic of Kant and his followers, made the definition a mere list of essential marks all standing upon one footing and aggregated together without any distinction between genus and difference. This, being an extremely nominalistic view, answers very well for the definitions of some artificial classes in mathematics, etc. (3) Modern logicians, recognizing that the elements of a definition are neither, in general, merely joined together without order nor always combined on one fixed model, conceive the definition to be an explanation of the construction of the concept to be defined out of others better known. According to the two first views alike, some concepts are indefinable because so abstract that no wider ones embracing them can be found; according to the third, no concept can be too abstract to admit of definition, the only indefinable ideas being such as the sensation of redness, the sense of fear, and the like, which direct experience alone can impart. An example of definitions conforming to the third conception is: "An *uncle* is the son of a parent of a parent"—a definition in which the notions of *son* and *parent* neither stand in the relation of genus and difference nor are merely aggregated together. Such also is the definition "Substance is the permanent element in the phenomenon."

Though definitions will serve to explain the names of substances as they stand for our ideas, yet they leave them not without great imperfection as they stand for things. *Locke*, *Human Understanding*, III. xi. 24.

Abundant definition, a definition which specifies characters which might be omitted without widening the class of things to which the definition applies.—**Accidental definition**, a description.—**Adequate definition** or **mark**, a definition which applies to every individual of the class defined, and to no other.—**Analytical definition**, a definition expressing an analysis of a notion already formed, and embodied in a word or phrase already in use.—**Causal definition**. See *causal*.—**Circle in definition**. See *circle*.—**Conceptual definition**, the analysis of a concept; the exact setting forth of the contents of a notion.—**Descriptive definition**, a definition which designates the thing defined by means of inessential attributes.—**Essential definition**, a strict definition stating the true constitutive essence of the definitum.—**Nominal definition**, an explanation of the meaning of a word.—**Real definition**, the statement of the design or idea of a real kind. Thus, any artificial object, as a sewing-machine, is defined by stating the purpose and the nature of the contrivance by which the purpose is intended to be attained. The real definition of a natural species supposes the species to owe its being to some intelligible idea which the definition attempts to state.—**Synthetical definition**, a definition expressing the mode of constructing a new conception; a definition for a new term therein proposed, or for a new sense proposed for an old word.

definitional (def-i-nish'on-al), *a.* [*< definition + -al*.] **1.** Of or pertaining to definition; used in defining.

Two distinct presentations are necessary to the comparison that is here implied; but we cannot begin with such *definitional* differentiation: we must first recognize our objects before we can compare them. *J. Ward*, *Encyc. Brit.*, XX. 49.

E. R. Lankester, *Degeneration*, p. 30.

And now to inquire briefly what is meant by *degeneration*. It means literally an unkindling, the undoing of a kind, and in this sense is first used to express the change of kind without regard to whether the change was to perfect or to degrade; but it is now used exclusively to denote a change from a higher to a lower kind: that is to say, from a more complex to a less complex organization; it is a process of dissolution, the opposite of that process of involution which is pre-essential to evolution.

Maudsley, *Body and Will*, p. 240.

Specifically—2. Loss or impairment of natural or proper qualities; descent to an inferior state; the act of becoming or the state of having become inferior, especially with respect to moral qualities.—3. Same as *cloudy swelling* (which see, under *cloudy*).—**Hypothesis of degeneration**, the hypothesis that certain organisms manifesting an inferior grade of structural and physiological characteristics are the degenerate descendants of higher forms. The theory makes the degeneration chiefly the result of disuse of parts; thus, the cetaceans are descendants from quadrupeds, and have assumed the fish-like form and lost their hind limbs in better accommodating themselves to aquatic life; the small-winged and flightless birds are descendants from those with well-developed wings, which, on account of residence in places where they were not much disturbed, have failed to exercise their wings, and finally lost the use of them, and they have aborted; the intestinal worms without an intestine are descendants from those with an intestine, but on account of their environments the skin has assumed the function of a nutrient medium and the intestine has been lost.—**Lardaceous degeneration**. Same as *lardaceous disease* (which see, under *lardaceous*).—**Mucoid degeneration**, the conversion of cells or intercellular substance into a semifluid translucent substance containing mucin.—**Parenchymatous degeneration**. Milton, P. L., v. 707.

5. In universities and colleges, an academical rank conferred by a diploma, originally giving the right to teach. The earliest degree was that of *master*, which in the university of Bologna, and others modeled on that (as were the faculties of law in all the old universities), was called the degree of *doctor*. Afterward the lower degree of *determinant* (later called *bachelor*) was introduced, and the intermediate degree of *licentiate*; but these were not regular degrees, except in the faculty of arts. The degree of *bachelor* was conferred by the "nation" of the faculty of arts; the others were given by the chancellor, by authority of the pope. Thus, the medieval degrees were: (1) the degree of determinant, or *bachelor of arts*, without a diploma; (2) the license; (3) the degree of *master of arts*; (4) the degree of *master*

or doctor of theology; (5) the degree of *master* or doctor of medicine; (6) the degree of doctor of laws. The degrees now usually conferred are *bachelor*, *master*, and *doctor*: as, *bachelor of arts*, *divinity*, *music*, or *law*; *master of arts*; *doctor of divinity*, *law*, *medicine*, *philosophy*, *music*, etc.

He [Wolsey] was born at Ipswich in Suffolk, the Son of a Butcher, sent to Oxford by Reason of his Pregnancy of Wit, so soon, that taking there the first Degree of Art, he was called the Boy Bachelor. *Baker, Chronicles*, p. 261.

The Universities ceased to teach the systematic theology of the Schools, and the systematic jurisprudence of the Decretals; and the ancient degrees of *bachelor* and *doctor* of the canon law are known, except during the reign of Mary, no more.

Stubbs, Medieval and Modern Hist., p. 319.

6. In *geneal.*, a certain distance or remove in the line of descent, determining the proximity of blood: as, a relation in the third or fourth degree. See *first extract*, and *forbidden degrees*, below.

In the canon law, degree of relationship is reckoned by the number of steps from the person farthest from the common ancestor to him; in the civil law, by the number of steps from one person up to the common ancestor and down to the other. Thus, a grand-uncle is related to his grand-nephew in the third degree by the canon law, in the fourth degree by the civil. *Stimson*.

She was as familiar as a cousin; but as a distant one—a cousin who had been brought up to observe degrees. *H. James, Jr., Harper's Mag.*, LXXVI. 342.

7. In *alg.*, the rank of an equation, as determined by the highest power under which an unknown quantity appears in it. Thus, if the exponent of the highest power of the unknown quantity be 3 or 4, the equation is of the third or fourth degree.

8. One of a number of subdivisions of something extended in space or time. Specifically—(a) One of a number of equal subdivisions on the scale of a meteorological or other instrument, as a thermometer. (b) A unit for measuring circular arcs and the angles subtended by them at their centers, being the 360th part of a circumference, or the 90th part of a right angle. Considered as angular magnitudes, all degrees are equal; considered as lengths of arcs, they are directly proportional to the radii of the circles of which they are parts. This manner of dividing the circle originated with the Babylonians about 2000 B. C., and was brought into use in Greece by the mathematician Hippicles. It was perhaps in its origin connected with an opinion that the year consisted of 360 days. The common abbreviation or sign for "degrees" is a small circle (°) placed to the right of the top of the last figure of the number of them: as, 45°. The degree is subdivided into 60 minutes, and the minute into 60 seconds. The length of a degree of latitude is the length of an arc of the section of the figure of the sea-level by a meridian, the difference of latitude between the extremities of this arc being one degree. (See *latitude*.) It is 68,702 statute miles at the equator, and 69,896 at the poles. The length of a degree of longitude is the length of an arc of the section of the figure of the sea-level by a plane parallel to the equator, the difference of longitude between the extremities of this arc being one degree. This is nearly proportional to the cosine of the latitude, and is equal to 69.16 statute miles at the equator.

(c) In *arith.*, three figures taken together in numeration: thus, the number 270,360 consists of two degrees (more commonly called *periods*). (d) In *music*: (1) One of the lines or spaces of the staff, upon which notes are placed. Notes on the same degree, when affected by accidentals, may denote different tones, as D, D[♯], and D[♭]; and, similarly, notes on different degrees, as D[♯] and C[♯], may denote identical tones, at least upon instruments of fixed intonation. (2) The difference or step between a line and the adjacent space on the staff (or vice versa). Occasionally, through the use of accidentals, this difference is only apparent (see above). (3) The difference, interval, or step between any tone of the scale and the tone next above or below it, as from *do* to *re*, from *mi* to *fa*. The interval may be a whole step or tone, a half step or semitone, or (in the minor scale) a step and a half, or augmented tone. See *step*, *tone*, *interval*, *staff*, *scale*. [To distinguish between degrees of the staff and degrees of the scale, the terms *staff-degree* and *scale-degree* are sometimes used.]

9. Intensive quantity; the proportion in which any quality is possessed; measure; extent; grade.

10. In *criminal law*: (a) One of certain distinctions in the culpability of the different participants in a crime. The actual perpetrator is said to be a principal in the *first degree*, and one who is present aiding and abetting, a principal in the *second degree*. (b) One of the phases of the same kind of crime, differing in gravity and in punishment. [U. S.]—**Accumulation of degrees.** See *accumulation*.—**By degrees**, step by step; gradually; by little and little; by moderate advances.

Chronic degree, one 360th part of a tropical year.—**Conjunct degrees**. See *conjunct*.—**Degree cut**. See *cut*.—**Degree of a curve**, the same as its order, but the latter term is preferable.—**Degree of constraint**. See *constraint*.—**Degree of freedom**. See *freedom*.—**Discrete degrees**. See *discrete*.—**Forbidden or prohibited degrees**, in civil and in canon law, degrees of consanguinity and affinity within which marriage is not allowed. The determination of these in church or canon law was founded on the prohibitions contained in Lev. xviii., with adherence to the principle that a degree of relationship which bars marriage in one sex bars it equally in the other, and that by Christ's declaration (Mat. xix. 6 and Mark x. 8, confirming Gen. ii. 24) a man and his wife become one flesh. The Roman law prohibited nearly the same degrees, though marriage of a man with his niece was permitted from the time of Claudius until forbidden by Nerva, and also from the time of Caracalla to that of Constantine. Marriages with a deceased brother's wife and a deceased wife's sister were forbidden by Constantine. Theodosius the Great forbade them between first cousins, and this was the general rule of the church from that time on. From the sixth to the thirteenth century, marriages within the seventh degree were prohibited; after the fourth Lateran Council (A. D. 1215), only those within the fourth degree. Marriage between godparents and godchildren was prohibited by Justinian, and this was afterward extended to include the parents of the children, and later still other relations of these. The presenter for confirmation was put on a par with the godparents. The Council of Trent limited such spiritual relationship to sponsors, to presenters at confirmation, to the persons baptized or confirmed, and the parents of these. In England marriage between first cousins was forbidden till the Reformation. The present English law of both church and state is conformed to a statute passed under Henry VIII., and revised under Elizabeth, which forbids all marriages not without the Levitical degrees. These degrees were tabulated by Archbishop Parker in 1563, and his table is adopted in the 99th canon of 1603, and ordered to be set up publicly in every church. It will also be found printed at the end of every English prayer-book. Its provisions have been summarized as follows: A man may not marry the mother or stepmother of his own or his wife's parents; the widow of his father, father-in-law, uncle, brother, son, stepson, or nephew; the aunt, sister, daughter, or niece of himself or his wife; the daughter or stepdaughter of his own or his wife's children. A woman may not marry the father or stepfather of her own or her husband's parents; the widower of her mother, mother-in-law, aunt, sister, daughter, stepdaughter, or niece; the uncle, brother, son, or nephew of herself or her husband; the son or stepson of her own or her husband's children. Marriage with a deceased wife's sister, whether expressed or implied, is prohibited by the Mosaic law or not, is prohibited as precisely analogous to that with a deceased husband's brother, the marriage of a man with his brother's wife being explicitly prohibited in Lev. xviii. Direct relationship, if in the ascending and descending line, is canonically reckoned as one degree, and marriage prohibited accordingly. In canon law an illicit connection is held to involve the same prohibitions as a marriage.—**In degree**, greatly; to a degree.

He was greved in degree,

York Plays, p. 53.

Local degree, one 360th part of the zodiac.—**Simeon's degree**, a certain early medieval degree, conjectured to have been one of bachelor, and to have been conferred upon masters in the University of Oxford. Biblical critics are not agreed as to the origin and significance of the title. See *gradual psalms*, under *gradual*.—**To a degree**, to an extreme; exceedingly; as, proud to a degree. [Colloq.]

Delphinidae (del-fin'i-dē), *n. pl.* [NL., < *Delphinus* + *-idae*.] A large family of odontocete cetaceans. By recent authors it has been limited to those having normally numerous teeth in both jaws; a short symphysis of the mandible, not exceeding one third the length of the jaw; no distinct lacrymal bones; the pterygoids short, scroll-like, and involuted; the caputular articulations of the ribs disappearing backward; the costal cartilages ossified; and the blow-hole median, transversely crescentic, and concave forward. In size and shape the *Delphinidae* vary greatly. With few exceptions they are marine. As above described, the family includes all the marine cetaceans known as dolphins, porpoises, grampuses, etc., as well as the caaing- or pilot-whales, belugas or white whales, and the narwhal. It has been divided into *Pontoporiinae*, *Delphinapterinae*, *Delphininae*, and *Globicephalinae*.

Delphinium (del-fin'i-um), *n.* [NL., < Gr. *delphion*, larkspur (so called from the form of the nectary, which resembles the ordinary representations of the dolphin), < *delphis*, *delphos*, a dolphin: see *dolphin*.] An extensive genus of the natural order *Ranunculaceae*, consisting of annual or perennial herbaceous plants, with usually blue, purple, or white flowers. The flowers are in loose racemes, and are very irregular, consisting of five colored sepals and only two conspicuous petals, the spurs of which are inclosed in the long spur of the upper sepal. There are 50 species or more, scattered over the northern temperate zone, 20 of which are found in the United States. Two species peculiar to California have red or yellowish flowers. Many are cultivated in gardens under the name of larkspur, chiefly *D. Ajacis* and *D. Consolida* of Europe, and *D. elatum* from Siberia, with numerous hybrids. One species, the *D. Staphisagria*, commonly called stavesacre, yields the vegetable alkaloid delphinine.

Delphinula (del-fin'ū-lā), *n.* [NL., dim. of *l. Delphinus*, a dolphin; so called on account of an imagined likeness to the conventional dolphin.] A genus of gastropods, typical of the family *Delphinulidae*.

delphinula. They are destitute of cephalic lobes, but have cirriform appendages to the foot, and otherwise the animals resemble those of the families *Turbinidae* and *Trochidae*. The living species are inhabitants of tropical seas. Numerous extinct forms have been referred to the family.

Delphinus (del-fi-nus), *n.* [*l.*, a dolphin: see *dolphin*¹ and *dolphin*.] 1. The typical genus of the family *Delphinidae*, to which very different limits have been assigned. (a) By the authors of the Linnean school it was used for all the cetaceans with teeth in both jaws, and consequently for the *Delphinidae* (except *Monodon*), *Platanistidae*, and *Iniidae*. (b) By later authors it was restricted to *Delphinidae*, but included at first all except those of the genera *Phocaena* and *Delphinapterus*; gradually others were excluded. (c) By recent authors it is restricted to species of *Delphininae* whose chief peculiarity is in the deep longitudinal grooves on the sides of the palate, separating the alveolar border from the median ridge. They have numerous (more than 80) small pointed teeth, close set along each jaw; from 50 to 90 vertebrae; the rostral part of the skull longer than the cranial portion, whence the head has a pointed snout marked off from the forehead by a groove; the dorsal fin large, triangular or falcate, sometimes wanting; and the flippers of moderate size, narrow, pointed, and falcate, with the lateral digits small or rudimentary. As thus defined, the genus contains the animals to which the word *dolphin* should be restricted, as the original dolphin of the ancients, *Delphinus delphis*, but which are commonly called *porpoises* by confounding them with the species of *Phocaena*, sometimes called *bottle-nosed* or *bay porpoises*. The tursio, *D. tursio*, is a larger and bulkier species. Sundry dolphins marked with white, and having from 80 to 90 vertebrae, constitute a group to which the name *Lagenorhynchus* is applied. A Chinese species, with only about

50 vertebrae, is called *Steno sinensis*. A species from the south seas, *D. peroni*, without a dorsal fin, has been called *Leucorhamphus* and *Delphinapterus*. See cut under *dolphin*.

It resembles Aich metal and stero-metal (see these words), the principal difference being that in the manufacture of *delta-metal* improvements have been made by means of which a fixed percentage of iron can be introduced, which was not the case with the other alloys mentioned, whence these never came into general use. *Delta-metal* is said to be as strong as mild steel, and to have the great advantage of not rusting. A small steamer has been constructed of this alloy for navigating the rivers of Central Africa. It is said, also, that it has been introduced as a material for rolls in powder-mills because not liable to give rise to sparks as steel rollers do, and that it is coming into use for many other purposes where strength is desired, and where the facility with which steel rusts makes its employment undesirable.

E. A. Freeman, *Amer. Lects.*, p. 383.

=Syn. 2. *Illusion*, *Delusion*, *Hallucination*. As now technically used, especially by the best authorities in medical jurisprudence, *illusion* signifies a false mental appearance or conception produced by an external cause acting through the senses, the falsity of which is capable of de-

tection by the subject of it by examination or reasoning. Thus, a mirage, or the momentary belief that a reflector in a mirror is a real object, is an *illusion*. A *delusion* is a fixed false mental conception, occasioned by an external object acting upon the senses, but not capable of correction or removal by examination or reasoning. Thus, a fixed belief that an inanimate object is a living person, that all one's friends are conspiring against one, that all food offered is poisoned, and the like, are *delusions*. A *hallucination* is a false conception occasioned by internal condition without external cause or aid of the senses, such as imagining that one hears an external voice when there is no sound to suggest such an idea. If a person walking at twilight, seeing a post, should believe it to be a spy pursuing him, and should imagine he saw it move, this would be an *illusion*; a continuous belief that every person one sees is a spy pursuing one, if such as cannot be removed by evidence, is a *delusion*; a belief that one sees such spies pursuing, when there is no object in sight capable of suggesting such a thought, is a *hallucination*. *Illusions* are not necessarily indications of insanity; *delusions* and *hallucinations*, if fixed, are. In literary and popular use an *illusion* is an unreal appearance presented in any way to the bodily or the mental vision; it is often pleasing, harmless, or even useful. The word *delusion* expresses strongly the mental condition of the person who puts too great faith in an illusion or any other error: he "labors under a delusion." A *delusion* is a mental error or deception, and may have regard to things actually existing, as well as to illusions. *Delusions* are ordinarily repulsive and discreditable, and may even be mischievous. We speak of the *illusions* of fancy, hope, youth, and the like, but of the *delusions* of a fanatic or a lunatic. A *hallucination* is the product of an imagination disordered, perhaps beyond the bounds of sanity; a flighty or crazy notion or belief, generally of some degree of permanence; a special aberration of belief as to some specific point: the central suggestion in the word is that of the groundlessness of the belief or opinion.

Poetry produces an *illusion* on the eye of the mind, as a magic lantern produces an *illusion* on the eye of the body. Macaulay, *Milton*.

Dreams or *illusions*, call them what you will,
They lift us from the commonplace of life
To better things. Longfellow, *Michael Angelo*.

4. A public exhibition, by a number of persons, of sympathy with some political or other cause, as in a mass-meeting or a procession.—5. Proof, either (a) a process of stating in an orderly manner indubitable propositions which evidently cannot be true without the truth of the conclusion so proved, or (b) the propositions so stated. Properly, demonstration is restricted to perfect proof, especially mathematical proof. (See the extract from *Burgersdicius*, below.) According to the Aristotelian doctrine, which has greatly influenced the use of the word, demonstration must be drawn from principles not only self-evident, but also undervied from any higher principles; and the conclusion must not only be shown to be true, but also to be a mere special case of the truth of one or more of the principles from which it is derived. It was supposed that this was the character of the best mathematical proofs; but mathematical proof consists in constructing a diagram or formula according to certain rules which prescribe that certain relations shall exist between the parts of that diagram, and then in showing by observation (directly or indirectly) that certain additional relations exist between those parts; and no important mathematical proof is of the nature of the Aristotelian demonstration. The word has consequently acquired two significations: first, its original sense of a perfect mathematical proof; second, the sense of a proof drawn from principles, as in the Aristotelian theory. There is also a third signification, according to which a demonstration is any proof which leaves no room for reasonable doubt, such as Kepler's proof that the orbit of Mars is an ellipse. Writers who adopt the Aristotelian view hold that the *reductio ad absurdum* and the Fermatian mode of proof, though entirely convincing, are not perfect demonstrations.

Some an admirable delight drew to Musick; and some, the certainty of demonstration to the Mathematicks. *Sir P. Sidney*, *Apol. for Poetrie*.

Demonstration is a syllogism made of such propositions as are true, first immediate, and manifestly known, and be the causes of the conclusion. First and immediate here is all one, signifying such propositions as need not be proved or made more evident by any other former propositions. *Blundeville*.

Demonstration, in the Greek ἀποδείξις, is amongst the geometers a delineation of a diagram, in which they exhibit the truth of their propositions to be seen by the eye. To that is opposed pseudographema: that is, a description or false delineation. Now these words, as many others, which are used in the doctrine of syllogism, are translated from geometry into logic; and there demonstration is taken sometimes for any certain and perspicuous proof, but here in this place strictly for syllogism scientific, and pseudographema, or false syllogism, for syllogism begetting error or contrary to science. *Burgersdicius*, tr. by a Gentleman.

Demonstration [is] nothing but the perception of such agreement [of ideas]; by the intervention of other ideas or mediums. *Locke*, *Human Understanding*, IV. iv. 7.

densimeter (den-sim'e-tēr), *n.* [= *Sp. densímetro, < L. densus, dense, + metrum, a measure.*] An apparatus for ascertaining the specific gravity or comparative density of a solid or liquid, as metals, gunpowder, or sea-water. That used for testing the density of gunpowder consists essentially of a vessel in which the gunpowder is weighed in connection with mercury. The vessel is first partially filled with mercury by creating a vacuum; it is then emptied and a known weight of powder is placed in it, and the mercury again added under the influence of the same vacuum, less being admitted, however, in consequence of the space occupied by the powder. A comparison of the amount of mercury admitted with the weight of the powder gives the specific gravity of the powder. The optical densimeter of Hilgard consists of a glass prism for holding salt water, and a collimating telescope for examining a ray of light passing through the water in the prism, the refraction of the light giving the density of the water by comparison with the known angle of refraction of distilled water or sea-water of a known density. *Huch's densimeter* is used for ascertaining the density of syrups while boiling. See *salmeter*.

density (den'si-ti), *n.* [= *F. densité = Sp. densidad = Pg. densidade = It. densità, < L. densita(t)-s, thickness, < densus, thick: see dense.*]

1. The quality of being *dense*, close, or compact; closeness of constituent parts; compactness, actual or relative.

The density of the ether is greater in liquids and solids than in gases, and greater in gases than in vacuo.

Tyndall, Light and Elect., p. 62.

2. The mass or amount of matter per unit of bulk. The mass is the ratio of the living force or double the energy of motion to the square of the velocity. Experiments made by Newton upon the effect of attaching masses of different materials to pendulums have shown that the weights of bodies are precisely proportionate to their masses; consequently, the density is measured by the specific gravity, or the weight of a unit bulk. The unit of density is generally taken as that of water at its temperature of maximum density (4° C., 39° F.) and under ordinary pressure. Inasmuch as the gram was intended

to be, and within the limits of the probable error of the best observations actually is, the mass of one cubic centimeter of water under these conditions, it follows that the density as ordinarily expressed is, as closely as possible, the number of grams in one cubic centimeter of the particular kind of matter in question. The following table shows the density of several important substances: Iridium, 22.4; platinum, 21.4; gold, 19.3; liquid mercury, 13.6; lead, 11.3; silver, 10.5; copper, 8.9; nickel, 8.7; iron, 7.8; tin, 7.3; zinc, 7.2; the earth, 5.6; solution of iodides of mercury and potassium, 3.2; diamond, 3.5; rock, about 2.7; aluminium, 2.6; sulphur, 2.0; magnesium, 1.7; the human body, 1.1; india-rubber, 1.0; alcohol, 0.8; ether, 0.7; lithium, 0.6; vapor of iodide of arsenic, 1.02; air, 0.0013; aqueous vapor, 0.0008; hydrogen, 0.00009. See *specific gravity*, under *gravity*.

The quantity of matter per unit of space is defined as the *density* of the mass filling that space.

A. Daniell, *Prin. of Physics*, p. 194.

The *density* of a body is measured by the number of units of mass in a unit of volume of the substance.

Clerk Maxwell, *Heat*, p. 82.

3. In *elect.*, the quantity of electricity per unit of volume at a point in space, or the quantity of electricity per unit of area at a point on a surface.

The electric volume-density at a given point in space is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the volume of the sphere, when its radius is diminished without limit.

The electric density at a given point on a surface is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the area of the surface contained within the sphere, when its radius is diminished without limit.

Clerk Maxwell, *Elect. and Mag.*, § 64.

dentagra (den-tag-rä), *n.* [*< L. den(t)-s*, = E. *tooth*, + Gr. *ἀγρα*, a hunting, catching, taken in the senses it has in *ροδάγρα*, a trap for the feet, also gout in the feet (> E. *podagra*), *χεράγρα*, gout in the hands (> E. *chiragra*).] 1. The toothache.—2. An instrument for drawing teeth; a tooth-forceps.

dental (den'täl), *a.* and *n.* [= *F. dental* = Sp. *Pg. dental* = It. *dentale*, < NL. *dentalis*, pertaining to the teeth (L. only in neut., *dentale*, *n.*, the share-beam of a plow), < L. *den(t)-s* = E. *tooth*: see *dent²* and *tooth*.] **I.** *a.* 1. Of or pertaining to the teeth.—2. In *gram.*, formed or pronounced at or near the front upper teeth, with the tip or front of the tongue: as, *d*, *t*, and *n* are dental letters. The name *dental* is very imperfectly descriptive, as the teeth bear no important part in producing the sounds in question, and even, in the utterance of many communities, no part at all. Hence some phonetists avoid the term, using instead *lingual*, *lingual-point*, or the like.

The Hebrews have assigned which letters are labial, which dental, and which guttural. *Bacon*.

3. Connected with or used in dentistry: as, *dental rubber*; a *dental mallet* or *hammer*.—**Dental arch**, the curved line of the teeth in their sockets, corresponding to the alveolar border of each jaw. The somewhat parabolic curve of this arch in man, and its continuity, are among the diagnostic zoological characters of the genus *Homo*.—**Dental canal**. See *canal*.—**Dental cartilage**. See *cartilage*.—**Dental cavity**, the natural hollow of a tooth; the pulp-cavity (which see).—**Dental chisel**, cut, drill, file, foramen, etc. See the nouns.

—**Dental formula**, a formal or tabular statement of the number and kinds of teeth a mammal may have; a formula of the dentition, in which the letters *i*, *c*, *pm*, and *m*, respectively denote *incisor*, *canine*, *premolar*, and *molar*, and figures are used to indicate the number of each kind of teeth, the figures above a horizontal line (like the numerator of a fraction) referring to the upper jaw, those below the line to the lower jaw. When the letter *d* is prefixed to *i*, *c*, *pm*, and *m*, it signifies *deciduous*, and consequently the formula is that of the milk-dentition. The dental formula is usually written in full, as in the subjoined extract; but since there are always the same number of teeth on each side of either jaw, sometimes only each half jaw is indicated: thus, the formula for adult man would be: *i* $\frac{2-2}{2-2}$, *c* $\frac{1-1}{1-1}$, *pm* $\frac{2-2}{2-2}$, *m* $\frac{3-3}{3-3}$ = 32. See the extract.

The dental formula of a child over two years of age is thus:

$$\begin{array}{ccccccc} \text{di.} & \frac{2-2}{2-2} & \text{dc.} & \frac{1-1}{1-1} & \text{dm.} & \frac{2-2}{2-2} & \frac{2-2}{2-2} = 20; \\ & & & & & & \end{array}$$

which means that the child should have two incisors, one canine, and two molars, on each side of each jaw. . . . The formula of the permanent dentition in man is written:

$$\begin{array}{ccccccc} \text{i.} & \frac{2-2}{2-2} & \text{c.} & \frac{1-1}{1-1} & \text{pm.} & \frac{2-2}{2-2} & \text{m.} & \frac{3-3}{3-3} = 32; \\ & & & & & & & \end{array}$$

there being two incisors, one canine, two premolars, and three molars on each side above and below.

Huxley, *Anat. Vert.*, p. 80.

Dental hammer. See *hammer*.—**Dental letter**. See *II.* 1.—**Dental mallet**. See *mallet*.—**Dental pulp**. (a) The soft, sensitive, nervous and vascular substance which fills the cavity of a mature tooth. (b) The tissue or structure out of which a tooth is formed, and from which, as in the case of rodents, it may continue to grow for an indefinite period, in which case the teeth are said to have *persistent pulps*.—**Dental sac**, a closed dental follicle. See the extract.

The teeth are moulded upon papillae of the mucous membrane, which may be exposed, but are more usually sunk in a fold or pit, the roof of which may close in so as to form a *dental sac*. *Huxley*, *Anat. Vert.*, p. 80.

II. *n.* 1. A sound formed by placing the end of the tongue against or near the upper teeth, as *d*, *t*, and *n* (see *I.*, 2).—2. In *conch.*, a tooth-shell; a shell of the family *Dentaliidae*.

Dentaliidae (den-täl-i'id-ä), *n. pl.* [NL., < *Dentalium* + *-iidae*.] A family of mollusks, constituting the class *Scaphopoda* (or order *Cirribranchiata* of *Gastropoda*); the tooth-shells. They are dioecious, headless, eyeless, with a trilobate foot, rudimentary lateral jaws, the mouth surrounded with filiform tentacles; the shell slender, conical, curved, open at both ends, with circular aperture and posterior attachment of the animal; the mantle saccular, open at both ends, the foot being protruded through the larger opening. The larvae are free-swimming and ciliate, with a somewhat bivalvular shell, which subsequently becomes tubular. There are about 50 living and upward of 100 extinct species, the latter mostly Devonian. The animals live buried in the mud, where they crawl slowly about. (See *Scaphopoda*, *tooth-shell*.) The family has been divided by recent systematists into various genera, for which the names *Dentalium*, *Antale*, and *Entalis* have been used. Also *Dentaliidae*, *Dentaliade*.

The dentary, as a rule, effects symphysis or unites with its fellow of the opposite side at its distal end; at its proximal end it is articulated or ankylized with other bones, forming the proximal part of each half of the lower jaw. as ivory, for instance, as distinguished from enamel, cement, or pulp. Dentin resembles bone, but is ordinarily denser and harder. The difference is seen on microscopic section, when a multitude of very fine close tubules or canaliculi (the dentinal tubes) are seen following a parallel straight or wavy course, and no corpuscles or lacunæ appear, while bone-tissue shows abundant corpuscles with the canaliculi radiating in every direction. The corpusculated parts of teeth are the softer constituents, as the cement or pulp, for example, whence the canaliculi alone penetrate the dentin, which is therefore comparable to the canalicular substance of bone in a state of extreme density and hardness. See cut under *tooth*.

The notch, nick, or tooth of the bill of the *Dentirostres* is not to be confounded with the tooth of the bill of certain birds of prey, as falcons, nor with the series of teeth of the lamelliostiral birds, as ducks. In very many technically dentirostral birds there is no trace whatever of a notch or tooth.

dentirostrate (den-ti-ros'trät), *a.* [**< L. den(t)-s**, = *E. tooth*, + *rostratus*, beaked, **< rostrum**, a beak: see *rostrum*.] Same as *dentirostral*.

Dentirostres (den-ti-ros'trēz), *n. pl.* [**NL.**, *pl. of dentirostris*, toothed-billed: see *dentirostral*.] 1. In Cuvier's system of classification, the first family of his *Passerine*, "wherein the upper mandible is notched on each side towards the point. It is in this family that the greatest number of insectivorous birds occur, though many of them feed likewise upon berries and other soft fruits." They are contrasted with *Fissirostres*, *Conirostres*, and *Tenuirostres*. The immense assemblage of birds here indicated is definable by no common character, least of all by the one assigned by Cuvier, and the term consequently fell into disuse. It is still employed, however, in a modified sense, for a superfamily group of oscine passerine birds approximately equivalent to the turdoid *Passeres* of Wallace. See *Passeres*, *Turdiformes*.

2. In Sundevall's system of classification, a phalanx of the cohort *Cichlomorphæ*: synonymous with *Laniiformes*, as the name of a superfamily group embracing the shrikes and their immediate relatives.—3. It. dentista*, **< NL. *dentista**, **< L. den(t)-s**, = *E. tooth*.] One whose profession it is to clean and extract teeth, repair them when diseased, and replace them when necessary by artificial ones; one who practises dental surgery and mechanical dentistry; a dental surgeon.

dentistic, dentalistic (den-tis'tik, -ti-käl), *a.* [**< dentist** + *-ic, -ical*.] Relating to dentistry or dentists.

Even the crocodile likes to have his teeth clean; insects get into them, and horrible reptile though he be, he opens his jaws inoffensively to a faithful dentalistic bird, who volunteers his beak for a toothpick.

2. In geol., the wearing away and removal by natural agencies, such as rain, rivers, frost, ice, and wind, of a part of the solid matter of the earth's surface. By the informed depth of a term, I mean all the real characters (in contradistinction to mere names) which can be predicated of it (with logical truth on the whole) in a supposed state of information; no character being counted twice over knowingly in the supposed state of information. The depth, like the breadth, may be certain or doubtful, actual or potential. By the essential depth of a term, I mean the really conceivable qualities predicated of it in its definition. Substantial depth is the real concrete form which belongs to everything of which a term is predicable with absolute truth.

It is similar to the crane, but differs from it in having the boom, which corresponds to the jib of the crane, pivoted at the lower end so that it may take different inclinations from the perpendicular. The weight is suspended from the end of the boom by ropes or chains that pass through a block at the end of the boom and thence directly to the *crab*, a winding-apparatus or motor at the foot of the post. Another rope connects the top of the boom with a block at the top of the post, and thence passes to the motor below. The motions of the derrick are a direct lift, a circular motion round the axis of the post, and a radial motion within the circle described by the point of the boom. On shipboard a derrick is a spar raised on end, with the head steadied by guys and the heel by lashings, and having one or more purchases depending from it to raise heavy weights.—**Floating derrick**, a movable derrick erected on a special boat or vessel. Such derricks have a single central post or support, and a horizontal boom supported at some elevation on the post and carrying a traveling carriage which bears the block from which the load is suspended. The boom is supported by stays from the top of the post, and is also counterbalanced by means of stays run from the opposite end of the boom to the deck of the vessel on which the derrick is built. The floating derrick used by the Department of Docks in New York has a lifting capacity of 100 tons, and a clear lift of 50 feet.

There are thirty-six orders of regular dervishes, who for the most part observe celibacy, and live in convents of not more than forty persons, under the supervision of a sheik or elder. Some, however, are permitted to marry and live with their families, but are required to spend at least two nights of each week in the monastery. The novitiate is severe, and the rules of the orders are strict. They are generally divided into two classes, viz.: *spinning* or *whirling dervishes* (*Mevlevîs*) and *howling dervishes* (*Rufais*). To the violent circular dances and pinwheeling of the spinning dervishes the latter add vociferous shouting and cries to Allah. The most important order of dervishes is that of the Mevlevîs, whose monasteries (Turkish *tekke*) are found at Konieh in Asia Minor, at Constantinople, and elsewhere.

According to the ancient mode of pronunciation, however, the first part of such feet took the stress, and the second not, regardless of pitch. The trochee (↗↘), dactyl (↗↘↘), ionic a minore (↗↘↘↘), first pæon (↗↘↘↘↘), and anapest (↗↘↘) form cola or verses with descending rhythm, in contrast with the iambus (↘↗), anapest (↘↘↗), ionic a minore (↘↘↘↗), fourth pæon (↘↘↘↘↘), and Bacchius (↘↘↘↘↘), which form series or lines with ascending rhythm.—*Descending series*, in *math.*, a series in which each term is numerically less than that preceding it; also, an infinite series in descending powers of the variable—that is, a series of the form $a + bx^{-1} + cx^{-2} + \text{etc.}$

2. The act of representing a thing by words or signs, or the account or writing containing such representation; a statement designed to make known the appearance, nature, attributes, accidents, or incidents of anything: as, a *description* of a house or of a battle.

Before a friend of this *description*
Shall lose a hair through Bassanio's fault.

In it are noted the previous service and a personal description of each man. (b) *Milit.*, a short military history of each enlisted man, with a description of his person, and an abstract of his account with the government. [U. S.]—**Descriptive muster-roll.** See *muster-roll*.—**Descriptive** (opposed to *metrical*) *property* or *proposition*, in *geom.*, usually defined to be a property or proposition which can be stated without introducing the idea of magnitude. But it would be better to say that it is a property or proposition which relates to the incidence or coincidence of points, lines, and other geometrical elements, in general, or that it is one which does not depend upon the particular system of measurement adopted. Thus, the

proposition that two triangles are equal if a side and two angles of the one are equal to the corresponding side and angles of the other, may be regarded as *descriptive*; while the proposition that through any point in space a single parallel to a given line can be drawn, is indisputably *metrical*, not *descriptive*.

We have in the plane a special line, the line infinity; and on this line two special (imaginary) points, the circular points at infinity. A geometrical theorem has either no relation to the special line and points, and it is then *descriptive*; or it has a relation to them, and it is then *metrical*.

A desert place or region; a waste; a wilderness; specifically, in *geog.*, a region of considerable extent which is almost if not quite destitute of vegetation, and hence uninhabited, chiefly on account of an insufficient supply of rain: as, the *desert* of Sahara; the Great American *Desert*. The presence of large quantities of movable sand on the surface adds to the desert character of a region. The word is chiefly and almost exclusively used with reference to certain regions in Arabia and northern Africa and others lying in central Asia. (See *steppe*.) The only region in North America to which the word is applied is the Great American Desert, a tract of country south and west of Great Salt Lake, once occupied by the waters of that lake when they extended over a much larger area than they now occupy. The name *Great American Desert* was originally given to the unexplored region lying beyond the Mississippi, without any special designation of its limits. Colonel Dodge, U. S. A., says in "The Plains of the Great West" (1877): "When I was a schoolboy my map of the United States showed between the Missouri River and the Rocky Mountains a long and broad white blotch, upon which was printed in small capitals 'The Great American Desert—Unexplored.' . . . What was then regarded as a desert supports, in some portions, thriving populations." In Fremont's report the Great Basin is frequently spoken of as "the Desert." It is also called the *Great Desert Basin*.

3. In *math.*, the sum of all the products which can be formed of a square block of quantities, each product containing as a factor one number from each row and one from each column of the block, and each product being affected by the plus or minus sign according as the arrangement of rows from which its factors are

taken (these factors being arranged in the order of the columns from which they are taken) requires an even or an odd number of transpositions to reduce it to the arrangement in the square. A determinant is conventionally denoted by writing the square block of quantities between two vertical lines. For example,

$$\begin{vmatrix} A & B \\ a & b \end{vmatrix} = Ab - aB.$$

$$\begin{vmatrix} A & B & C \\ a & b & c \\ \alpha & \beta & \gamma \end{vmatrix} =$$

$$Aby - Agc + a\beta C - abC + aC - aBy.$$

The different products of which a determinant is the sum are called its *elements*. The different quantities which are multiplied to form the elements are called the *constituents* of the determinant. The oblique line of places from the upper left-hand to the lower right-hand corner is called the *principal diagonal*. The conjugate line of places is called the *secondary diagonal*. The square root of the number of constituents is the ordinal number of the *order* or *degree* of the determinant.—**Adjugate determinant**, one each of whose elements is the cofactor of the corresponding term of the determinant to which it is adjugate.—**Axisymmetric determinant**, a determinant related to a partial determinant to which it is said to be complementary, by having for its constituents all the constituents of the total determinant which belong to rows and columns from neither of which any constituent of the partial determinant has been taken, the sign of the complementary determinant being determined by taking its matrix as it stands in the lower right-hand corner of the matrix of the total determinant, when the matrix of the partial determinant has been brought to the upper left-hand corner, without altering the value of from the matrix of a partial determinant.—**Composite determinant**, a sum of determinants whose matrices are obtained by successively omitting all the different combinations of n -columns from a rectangular block of quantities having n -rows and m - n -columns. The composite determinant is usually denoted by writing its oblong matrix with two vertical lines on each side.—**Compound determinant**, a determinant whose constituents are themselves determinants.—**Cubic determinant**, a quantity formed on the analogy of a determinant proper from a cube of quantities as constituents.—**Cyclic determinant**, same as *circulant*.—**Determinant of a linear transformation or substitution**, the determinant whose constituents are the coefficients of the equations of transformation regularly arrayed.—**Functional determinant**, one in which all the constituents in each row are differential coefficients of one quantity, while all the constituents in each column are differential coefficients with respect to one variable.—**Gauche determinant**, same as *skew determinant*. See below.—**Minor determinant**, or *minor* of a determinant, a determinant whose matrix is formed from the matrix of another determinant by erasing part of the rows and columns.—**First minor**, a minor formed by erasing one row and one column; **second minor**, a minor formed by erasing two rows and two columns, etc.— **N -dimensional determinant** of the n th order, a function of n th constituents, analogous to an ordinary determinant.—**Orthosymmetric determinant**, one all the constituents of which, having the sum of the ordinal places of the row and column the same, are equal.—**Partial determinant**, same as *minor determinant*.—**Perisymmetric determinant**, one which is symmetrical with reference to both diagonals.—**Reciprocal determinant**, a determinant each constituent of which is the corresponding first minor of the determinant of which it is the reciprocal.—**Skew determinant**, one in which every constituent of the i th row and j th column is in every case the negative of the one in the j th row and i th column, except on the principal diagonal. Also called *gauche determinant*.—**Skew symmetric determinant**, a skew determinant in which all the constituents of the principal diagonal vanish.—**Symmetric determinant**, one in which the constituent in the i th row and j th column is in every case equal to that in the j th row and i th column.—**Zeroaxial determinant**, one in which the constituents of the principal diagonal are all zeros. [The name *determinant* in a narrower sense was introduced by Gauss, and was first applied in the present sense by Cauchy.]

12. [ML. *determinatio questionis*, the answering a question, the posting of theses to be defended.] In Oxford and other old universities: (a) A solemn disputation in which the respondent is a bachelor of arts, and which is preparatory to graduation as master of arts. (b) A disquisition or other act substituted in recent times for the old disputation. The *determinations* were kept in Lent, and hence often called the *Lent determinations*. Originally, in the University of Paris (the model of most of the old universities of northern Europe, and especially of Oxford and Cambridge), there was but one degree, that of master of arts, carrying with it the right to lecture regularly in the university. The purpose of the *determinations* was to enable the masters to judge whether the candidate was fit to be presented to the chancellor as candidate for the mastership; and since there were no examinations, there was no other regular means of ascertaining the candidate's fitness. The baccalaureate was at first called the *determinance*, and was originally not a degree, nor conferred by the university, but merely a permission to *determine* or act as chief respondent in the Lent disputations, and was conferred by the "nation." In consequence of this inseparable connection between the baccalaureate and the *determinations*, the latter are often considered as conditions of the former, although they follow in time.

Hence—13†. A discussion of a question according to the scholastic method, after the model of a disputation.

The great bulk of the yolk of meroblastic ova, as birds' eggs, consists of the nutritive deutoplasm or food-

yolk, as distinguished from the protoplasm or tread, which makes up into the body of the chick.

In fact, the contents of every egg consist of two parts—(1) of a viscous albuminous protoplasm; and (2) of a fatty granular matter, the *deutoplasm* or food yolk. The first is derived from the protoplasm of the original germinal cell, while the yolk is only secondarily developed with the gradual growth of the first; and not unfrequently it is derived from the secretion of special glands.

It has, however, established itself in works on Indian Palaeography, and may be conveniently retained to denote that particular type of the Nagari character employed in printed books for the sacred Sanskrit literature, while the generic term Nagari may serve as the designation of the whole class of vernacular alphabets of which the *Devanagari* is the literary type.

2. In *photog.*, to induce the chemical changes in (the film of a plate which has been exposed in the camera or of a gelatino-bromide print) necessary to cause a latent image or picture to become visible, and, in the case of a negative, to assume proper density to admit of reproduction by a process of printing.—3. In *biol.*, to cause to go through the process of natural evolution from a previous and lower stage, or from an embryonic state to a later and more complex or perfect one.

Where eyes are so little developed that approaching objects are recognized only as intercepting the sunshine, it is obvious that contrasts of light and shade which seem marked to animals with developed eyes are quite imperceptible.

H. Spencer, Prin. of Psychol., § 92.

2. In *geom.*, reducible to a plane by bending; applied to a particular species of ruled surface, otherwise called a *torse*, which is conceived as formed by an infinite succession of straight lines, each intersecting the next.—**Developable helicoid.** See *helicoid*.

II. *n.* In *geom.*, a singly infinite continuous succession of straight lines, each intersecting the next; a *torse*. The word *developable* is used as a noun by modern geometers, because they do not consider this locus to be properly a surface. It is rather a skew curve regarded under a particular aspect. A developable is generated by a line which turns about a point in itself, while this point moves along the line. The locus of the point is a skew curve, called the edge of regression of the developable, to which the line is constantly tangent. The developable is thus the locus of tangents of a skew curve. Considering the osculating plane at any fixed point of this curve, the moving tangent comes up to this plane so that for an instant its motion is in the plane and then passes off; and the result is that the curve is a cuspidal edge of the developable considered as a surface.—**Polar developable** of a skew curve, the surface enveloped by its normal planes. The locus of the center of curvature of the skew curve is the edge of regression, while the axis of curvature is the generator of the polar developable.

Sir E. Cressy, Eng. Const.

Specifically, in *photog.*, the chemical bath in which a sensitized plate or paper is, after a photographic exposure to the light, immersed to develop or bring out the latent image. Developers for the ordinary dry-plate process may be divided into two principal classes, *alkaline developers* and *ferrous-oxalate developers*, the first generally employing carbonate of soda or potash in combination with pyrogallol acid, and the second using oxalate of potash with protosulphate of iron. The results obtained are practically the same with either bath, the latent image in the film being made visible, and the chemical changes induced being fixed, or made permanent in the fixing bath, which follows the developing bath. Many other chemicals may be used in development, either in combination with some of those mentioned above or in independent combinations. See *photography*.

M. Balagny claims "that with this chemical he has developed plates without fog in such a light as would have been impossible . . . with other known developers." Philadelphia Ledger, Feb. 28, 1888.

development (dē-vel'up-ment), *n.* [Also *development*; < F. *développement*, < *développer*, develop: see *develop* and *-ment*.] 1. A gradual unfolding; a full disclosure or working out of the details of something, as the plot of a novel or a drama, an architectural or a military plan, a financial scheme, etc.; the act of evolving or unraveling.—2. Specifically—3. In *biol.*, the same as *evolution*: applied alike to an evolutionary process and its result.

(b) The bending of a surface into a plane, or of all its infinitesimal parts into parts of a plane. (c) The bending of a non-plane curve into a plane curve.—5. In *photog.*, the process by which the latent image in a photographically exposed sensitive film is rendered visible through a chemical precipitation on that portion of the sensitized surface which has been acted on by light. The matter deposited varies with the nature of the process. In the daguerreotype process it is mercury; in negative processes with salts of silver it is silver combined with organic matter.

6. In *music*: (a) The systematic unfolding, by a varied rhythmic, melodic, or harmonic treatment, of the qualities of a theme, especially in a formal composition like a sonata. (b) That

(See *refraction*.) The minimum of deviation, or least change of direction, for a ray passing through a prism, takes place when the angles of incidence and emergence are equal.—**Deviation of the compass**, the deviation of the north point of a ship's compass from the magnetic meridian, caused by the counter-attraction of the iron in the ship. For ships which are to remain in the same magnetic latitude, this error may be corrected or compensated by placing magnets near the affected compass. Compasses are frequently elevated above the deck on tripods or masts to obviate the effects of the ship's magnetism, the direction and amount of which depends to a certain extent upon the position of the ship's head with reference to the points of the compass while building. In iron ships a careful determination of this error, with the ship's head on every point of the compass successively, is essential to safe navigation.—**Primary deviation**, in *ophthal.*, the deviation of the weaker eye from that position which would make its visual line pass through the object-point of the healthy eye.—**Secondary deviation**, in *ophthal.*, the deviation of the healthy eye from the position which would make its visual line pass through the object-point of the weaker eye.

[This use of the original term *diabolos* occurs several times in the New Testament (1 Tim. iii. 11; 2 Tim. iii. 3; Tit. ii. 3), but this is the only instance in which, when so used, it is rendered *devil* in the English versions.]

2. In Christian theology, a powerful spirit of evil, otherwise called Satan (the adversary or opposer): with the definite article, and always in the singular. He is frequently referred to as the Evil One, the prince of the powers of the air, the prince of darkness, Beelzebub, Belial, the tempter, the old serpent, the dragon, etc. He is represented in the New Testament as a person, the enemy of God and of holiness, and bent on the ruin of man, but possessing only limited power, subordinate to God, able to operate only in such ways as God permits, and capable of being made subservient to God's will. In this respect he differs from Ahirman, the evil principle in the dualistic system of the Persians, who was coeval and coordinate with Ormuzd, the spirit of light and goodness, and from the devil of the Gnostic and Manichean systems. The medieval conception of the devil was largely derived from pagan mythology.

Mark xvi. 9.

4. A false god; an idol. [In the authorized version of the Old Testament the word *devil* occurs four times: twice (Lev. xvii. 7; 2 Chron. xi. 16) translating Hebrew *sairim*, rendered in the revised version "he-goats" or "satyrs," and twice (Deut. xxii. 17; Ps. cvi. 37) translating Hebrew *shedim*, rendered "demons" in the revised version. In the New Testament *δαίμων*, or *demon*, is in one instance (see extract) rendered "devil," in the sense of an object of gentle worship, an idol, a false god.]

The term was applied specifically, in *geol.*, by Murchison to a great part of the Paleozoic strata of North and South Devon, and used by him as synonymous with *Old Red Sandstone*, for which term he substituted it, "because the strata of that age in Devonshire—lithologically very unlike the old red sandstone of Scotland, Hereford, and the South Welsh counties—contain a much more copious and rich fossil fauna, and were shown to occupy the same intermediate position between the Silurian and Carboniferous rocks." Later geologists, however, do not use the terms as identical, the conditions under which the strata were deposited being very different.

=Syn. *Devote, Dedicate, Consecrate, Hallow, destine, set apart.* In *dedicate* and the cognate words *devote, devout*, etc., the root idea is always that of a complete mental consecration; thus, *devotion* (def. 2) is the consecration of the entire mind to God and his worship; and a *devout* (def. 1) spirit is one entirely absorbed in the worship or service of God. To *devote* indicates the inward act, state, or feeling; to *dedicate* is to set apart by a promise, and indicates primarily an external act; to *consecrate* is to make sacred, and refers to an act affecting the use or relations of the thing consecrated; to *hallow* is to make holy, and relates to the character of the person or thing hallowed. Thus, we *devote* ourselves by an act of the mind; we *dedicate* our lives or property by a more formal act; we *consecrate* to sacred uses a building not before sacred; and we *hallow* the name of God, recognizing in it its inherent holy character.

The aqueous vapor which is deposited from the atmosphere by condensation, especially during the night, in the form of small drops on the surface of bodies. The formation of dew is explained by the loss of heat by bodies on the earth's surface through radiation at night, by which means they and the air immediately about them are cooled below the dew-point (which see). Dew is thus deposited chiefly on bodies which are good radiators and poor conductors of heat, like grass; hence also it appears chiefly on calm and clear nights—that is, when the conditions are most favorable for radiation. Di. (*a*) The chemical symbol of the metal *dium*. (*b*) [*L. c.*] An abbreviation of Latin *dimidius*, half.

di-1. [*L. di-*: see *dis-*. Cf. *de-*.] A prefix of Latin origin, the form of *dis-* before certain consonants: see *dis-*. In some words in earlier English the prefixes *di-* and *de-* often interchanged; whence in modern English some with original *de-* have now also or only *di-*, as *divest*, while others with original *di-* have now *de-*, as *devise*, *device*, etc.

di-2. [*L.*, etc., *di-*, < Gr. *di-*, two-, double, combining form of *dic*, adv., twice, doubly (= *L. bis*, *bi-* = Skt. *dvī-* = E. *twi-*, etc.), < *diō* = E. *two*: see *bi-2*, *twi-*, *two*.] A prefix of Greek origin, cognate with *bi-2* (which see), and meaning 'two-, twofold,' 'double,' as in *dipterous*, two-winged, *diptych*, a two-leaved tablet, *diarchy*, government by two, etc. In chemistry it denotes that a compound contains two units of the element or radical to which *di-* is prefixed: as, manganese dioxide, MnO₂, a compound of one atom of manganese and two of oxygen.

di-3. A prefix of Greek origin, the form of *di-* before a vowel. See *dia-*.

dia- [*L.*, etc., *dia-*, < Gr. *dia-*, prefix, *diá*, prep., through, throughout, during, across, over, by, etc., orig. **dīa*, < **dīo*, *dīo* = E. *two*: connected with *dic*, doubly, and *L. dis-*, *di-*, apart, asunder: see *di-1*, *di-2*, *di-3*, *dis-*.] A prefix of Greek origin, meaning in Greek, and so, with modifications, in modern speech, 'through, right through, in different directions, asunder, between,' etc.: often intensive, 'thoroughly, utterly,' etc.

diabantite (dī-a-ban'tit), *n.* [Irreg. < *diabase* (altered as if Gr. *diabās* (*diabav-*), 2d aor. part. of *diabaiw*, go through or over: see *diabase*) + *-ite*.] A chloritic mineral found filling cavities in basic eruptive rocks, like basalt and diabase.

diabase (dī'a-bās), *n.* [*< dia-*, erroneously for *di-2*, double, + *basē*.] The form simulates Gr. *diabasis*, a crossing over, < *diabaiw*, go through or over, < *diá*, through, + *baiw*, go: see *basis*.]

The name originally given by A. Brongniart to a rock which Haüy later designated as *diarite*, which name Brongniart himself adopted in preference to that of *diabase*. Later (in 1842) Hausmann again introduced the word *diabase*, and by it designated a variety of pyroxenic rock, occurring in the Harz, and characterized by the presence of chlorite in considerable quantity. At the present time the name *diabase* is used to designate a crystalline-granular rock, consisting essentially of augite and a triclinal feldspar, with more or less magnetite or titaniferous iron, or both, and occasionally apatite or olivine, to which is added chloritic matter in varying amount. To this chloritic material the name *viridite* is frequently applied, this being the substance which gives the mass the greenish color which it frequently has. Diabase is one of the rocks included under the popular designation of *greenstone*, and also under that of *trap*. It is an altered form of basalt. "The main difference between *diabase* and *basalt* appears to be that the rocks included under the former name have undergone more internal alteration, in particular acquiring the diffused 'viridite' so characteristic of them" (Gekie, 1895). See *greenstone*, *trap*, *diarite*, and *melaphyre*.

The former is distinguished by the presence of an excessive quantity of sugar in the urine, and to it there is a strong tendency to restrict the name. Light and evanescent grades of glucosuria are not considered as diabetes, and doubtless frequently have an entirely different causation. The disease is chronic and generally fatal. Its essential pathology is unknown. It is not an affection of the kidneys, but depends upon the accumulation of sugar in the blood, or glucemia. (See *glucosuria*.) Diabetes insipidus, or polyuria, is characterized by the discharge of abnormally large quantities of ordinary or watery urine.

Thus, the marks attached to *a* in the forms *ā, â, a*, are diacritical marks, or diacritics. So in the angular German running-hand the letter *u* (*u*) is written thus, *ü*, to distinguish it from *u* (*u*); and the dot over the *t*, formerly used also over *y*, has a like office. Diacritical marks and points are regularly used as a part of the alphabetical systems of many languages.

by parallel lines drawn obliquely at equal distances across the parallel. Such a scale facilitates laying down small fractions of the unit of measurement. Thus, if, in the figure, the distance from 0 to 10—one inch—is divided into 10 equal parts, the diagonal which ends at 0 cuts off upon the parallel lines $\frac{1}{10}$, $\frac{2}{10}$, etc., inch respectively; the next diagonal cuts off $\frac{3}{10}$, $\frac{4}{10}$, etc.—*Diagonal triangle*, a triangle formed by the three diagonals of a complete quadrilateral, or the three diagonal points of a quadrangle.

(b) A diagram in which the accelerations of particles are represented in magnitude and direction by lines drawn from points showing the positions of those particles.—*Configuration-diagram*, a diagram which shows the relative positions of the parts of a system by means of the relative situations of points, but does not, like a plan,

show the forms of different bodies.—*Contrast-diagram*, a color-diagram showing the relations of contrast between colors.—*Displacement-diagram*. The area of the diagram measures the total work performed by the piston during the stroke. This work, expressed in foot-pounds, divided by Joule's equivalent, gives the heat-equivalent of the work performed, in British thermal units. (See *indicator*.) These diagrams may be obtained from nearly all kinds of heat-engines. Also called with the paper of which it is traced *indicator-card*.—*Metrical diagram*, a figure drawn to scale from numerical data for the purpose of ascertaining the values of other quantities by measurement.—*Newton's diagram*, a diagram in which the points represent colors, weights attached to points represent luminosities, and collinear points represent colors which can be produced by mixtures of two colors.—*Reciprocal diagrams*, two diagrams such that to every point of concurrence of lines in either corresponds a closed polygon in the other.—*Resultant diagram*, a line upon a force-diagram showing the direction and position of the resultant of the forces.—*Stereoscopic diagrams*, a pair of diagrams, perspective representations of a solid diagrammatic figure, intended to be optically combined by means of a stereoscope.—*Stress-diagram*. 2. One of a number of related modes of speech, regarded as descended from a common original; a language viewed in its relation to other languages of the same kindred; the idiom of a district or class, differing from that of other districts or classes. Thus, the Scotch is a dialect of English; English is a dialect of the Germanic or Teutonic group; Germanic speech is an Aryan or Indo-European dialect. Of the various dialects of Greek—Attic, Ionic, Doric, Æolic, and so on—the Attic finally became the common dialect of all cultivated Greeks. Every literary language is originally one of a body of related dialects, to which favoring circumstances have given vogue and general acceptance.

The Dane was converted; he sank into the general mass of Englishmen; his tongue became simply one of the local *dialects* of English. *E. A. Freeman*, *Amer. Lects.*, p. 152.

II. *n.* [= *F. dialectique = Sp. dialéctica = Pg. dialectica = It. dialettica = G. Dan. Sw. dialektik, < L. dialectica, < Gr. διαλεκτική (sc. τέχνη), the dialectic art, the art of discussion, logical debate, also the logic of probabilities, fem. of διαλεκτικός, belonging to disputation; see L.*] 1. Logic, or a branch of logic; specifically, the art of critical examination into the truth of an opinion; inductive logic applied to philosophy; the logic of probable reasoning; the art of discussion and of disputation; logic applied to rhetoric and refutation. The invention of the art of dialectic is attributed to Zeno the Eleatic, whose arguments against motion are examples of the original meaning of the Greek word. The famous dialectic of Socrates and Plato, their chief instrument of philosophical inquiry, was a conversational discussion with inductive appeals to special instances. Dialectic was limited by Aristotle to logic accommodated to the uses of the rhetorician, appealing only to general belief, but not to first principles. The Stoics, who probably introduced the term *logic*, divided that art into rhetoric and dialectic, the former being the art of continuous discourse, the latter that of discussion with an interlocutor. Cicero and other Latin writers, influenced by Stoic doctrine, understand by dialectic "the art of discussing well" (*ars bene disserendi*). It thus became the name of that branch of the trivium of the Roman schools which we call *logic*, and retained that meaning throughout the middle ages. Hence, in all the earlier English literature, it is the synonym of *logic*, differing from that word only by a more distinct suggestion of the idea of disputation. Modern logicians have frequently restricted it to the doctrines of the Topics and Sophistical Elenchi, or to the former alone. It has also been used as a synonym of *sylogistic*. Kant named the constructive part of his *Transcendental Logic* *transcendental analytic*, and the destructive part *transcendental dialectic*. For the sake of this phrase, he makes dialectic, in general, the theory of fallacies. According to Hegel, each concept in the development of thought by a primitive necessity develops its own diametrical opposite, and to this reaction of thought against itself, regarded not as final, but as subject to a subsequent reconciliation in a higher order of thought, he gave the name of *dialectic*.

There hath not been, to my understanding, sufficiently inquired and handled the true limits and use of reason in spiritual things, as a kind of divine *dialectic*.

Bacon, *Advancement of Learning*, ii. 364.

We termed *Dialectic* in general a logic of appearance. This does not signify a doctrine of probability; for probability is truth, only cognized upon insufficient grounds, and though the information it gives us is imperfect, it is not therefore deceitful. *Kant*, tr. by Meiklejohn.

St. Paul, though bred in the *dialectic* of the Greek schools, came late by his conversion to the new faith, and remained a Jew to the last. *Alcott*, *Table-Talk*, p. 99.

It remains true that the value of the *Dialectic* which asks and gives such an account of ideal good as at once justifies and limits obedience to practical authorities is conditional upon its finding in the individual a well-formed habitual morality.

T. H. Green, *Prolegomena to Ethics*, § 328.

In *chem.*, the act or process of separating the soluble crystalloid substances in a mixture from the colloid, depending on the principle that soluble crystalloid bodies will diffuse readily through a moist membrane, while colloids diffuse very slowly, if at all. This is done by pouring a mixed solution of crystalloid and colloid on a sheet of parchment-paper stretched over a wooden or gutta-percha hoop, having its edges well drawn up and confined by an outer rim. The parchment is allowed to float in a basin of water. Diffusion immediately commences, the crystalloid passing through and dissolving in the water beneath, while the colloid remains behind. Thus, gruel or broth containing a very little arsenic dissolved in it gives up the whole of its arsenic to the water, while scarcely a trace of the organic substance passes through. As almost all the poisons in common use—arsenic, corrosive sublimate, oxalic acid, lead acetate, morphia, and salts of strychnine, etc.—are crystalloids, the toxicologist is by this process furnished with an easy mode of detecting their presence, if they are in a form readily soluble in water.

It consists in increasing the number of equations by successively multiplying them by combinations of powers of the unknowns, until a system of equations is obtained from which the unknown factors of the different terms can be eliminated as independent quantities, the equations being regarded as linear.—**Dialytic telescope**, a telescope in which the flint-glass lens is brought down to about half the distance of the crown-glass lens from the eye. diamond-cutting (dī'-a-mōnd-kut'ing), *n.* One of three processes by which diamonds are prepared for use as ornaments or in the arts, the others being diamond-cleaving and diamond-polishing. Diamond-cutting is performed by rubbing together two diamonds secured with shellac in wooden holders or handles, one of which is held in each hand of the cutter over the edge of a box called a cutters' box, into which the dust is allowed to fall. This rubbing is continued until each diamond assumes the proper outline, whether brilliant, rose, or briquette, the smaller facets being afterward made by polishing. Both stones are cut at the same time, irrespective of size or shape, or of the outline to be produced. Diamond-cutting is sometimes performed by machinery. In this case one of the handles or dops is stationary and the other is moved backward and forward, both diamonds being cut at the same time, but more rapidly and accurately than by hand.

In *anat.*, the midriff; the musculomembranous partition which separates the thoracic from the abdominal cavity in mammals. In man the diaphragm consists of a muscular sheet whose fibers

radiate from a trefoil tendinous center to attach themselves to the lower margins of the thorax, and behind form a large bundle on either side, called *pillars of the diaphragm*. The diaphragm is pierced by three principal openings: the *esophageal*, for the passage of the esophagus accompanied by the pneumogastric nerves; the *aortic*, for the passage of the aorta, thoracic duct, and large azygos vein; and the *caval*, for the inferior vena cava; besides some others for splanchnic nerves, etc. The diaphragm is invested on its thoracic surface by the pleural and pericardial serous membranes; on its abdominal surface by the peritoneum, a fold of which, reflected upon the liver, forms the suspensory ligament of that organ. The diaphragm is deeply concavo-convex, the convexity upward; the general figure is that of an umbrella. It is a powerful respiratory muscle, contracting at each inspiration and so flattening, while its relaxation in expiration renders it more convex; its contraction also assists in defecation and in parturition, and its spasmodic action is concerned in hicough and sneezing; when most relaxed it rises to the level of about the fifth rib. A rudimentary diaphragm exists in birds; it is best developed in the apteryx.

It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113°, a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering it. Diastase is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol. In solution it possesses the property of causing starch to break up at the temperature of 150°, transforming it first into dextrin and then into sugar.

diastasis (dī-as'tā-sis), *n.*; pl. *diastases* (-sēz). [*NL.*, < *Gr. διάστασις*, a separation, < *διαστέλλω*, pres. *διασάτω*, separate, cause to stand apart, < *διá*, apart, + *στέλλω*, pres. *ιστάτω*, cause to stand, = *E. sta-nd*.] Forcible separation of bones without fracture, as the result of external mechanical injury or direct violence; dislocation; luxation.

diastema (dī-ā-stē'mā), *n.*; pl. *diastemata* (-mā-tā). [*LL.*, an interval, esp. in music, < *Gr. διάστημα*, an interval, difference, < *διαστέλλω*, separate: see *diastasis*.] 1. In *zool.* and *anat.*, an interval between any two consecutive teeth, especially between any two series or kinds of teeth, as between the canines and premolars or incisors, or among the incisors, as in many bats. When there are no canines, as in rodents, diastema occurs between the incisors and the premolars. It necessarily occurs when opposing teeth are so long that they cross each other when the mouth is shut. Man is notable as having normally no diastemata, his teeth forming a continuous series, and being all of approximately equal lengths. But the same is the case with some other mammals, as in the genera *Tareius* and *Anoplotherium*.

2. In *anc. Gr. music*, an interval. Also *diastēm*. **diaster** (dī-as'tēr), *n.* [*Gr. δι-, two-, + ἀστήρ*, star.] In *biol.*, a double star; the caryocentric figure which results from the aster of a nucleus before this separates into two nuclei. See *aster* and *caryocinesis*. Also *dyaster*.

diastole (dī-as'tō-lē), *n.* [*LL.*, < *Gr. διαστολή*, dilatation, expansion, lengthening of a syllable, < *διαστέλλω*, dilate, expand, put asunder: see *diastaltic*.] 1. The normal rhythmical dilatation or relaxation of the heart or other blood-vessel, which alternates with *systole* or contraction, the two movements together constituting pulsation or beating: as, auricular *diastole*; ventricular *diastole*. The term is also extended to some other pulsating organs, as lymph-hearts, and specifically to the expanding action of the contractile vesicle of infusorians and other protozoans.

2. The period or length of time during which a rhythmically pulsating vessel is relaxed or dilated; the time-interval which alternates with *systole*.—3. In *Gr. gram.*, a mark similar in position and shape to a comma, but originally semicircular in form, used to indicate the correct separation of words, and guard against a false division, such as might pervert the sense. Such a sign was needed to obviate the confusion arising from the ancient practice of writing without division between words. The diastole is still occasionally used, generally in order to distinguish the pronominal forms *ἐγ*, *ἡ*, and *ἐν*, "whatever, which," from the particles *ἐν*, "that," and *ἐν*, "when." The usual practice at present, however, is to use a space instead of the diastole. When the present shape of the comma came into use, more or less confusion between it and the diastole necessarily ensued. Also called *hypodiastole*. See *hypphen*.

4. In *anc. pros.*, lengthening or protraction of a syllable regularly short; especially, protraction of a syllable preceding a pause or taking the ictus: as,

Ire negabamūs et tecta ignota subire.
Ovid, Metamorph., xiv. 250.

Most cases of diastole in Latin poetry are supposed to be instances of reversion to an older pronunciation, though the pause which usually follows could of itself make good the metrical deficiency. This reversion is seen chiefly in verb-terminations with final *t* and *r*: as,

Quidus ut solent humeris portare viator.
Horace, Satires, I. v. 90.

diastolic (dī-ā-stol'ik), *a.* [*< diastole + -ic.*] Pertaining to, or produced by, diastole.

[*< Gr. di-*, two- + *κοτυλήδων*, a cavity: see *cotyledon*.] A plant which produces an embryo having two cotyledons. *Dicotyledons* form a natural class of the phenogamous series of plants, characterized by the two opposite cotyledons, an exogenous mode of growth, and a netted venation of the leaves, and by seldom having a trimerous arrangement of the parts of the flower. From the structure of the stem, increasing by external growth, they are also known as *exogens*. The gymnosperms, in which the embryo has several cotyledons in a whorl, are usually included as a subclass, but by some recent botanists they are ranked as a distinct class. According to the more usual arrangement, the angiospermous *dicotyledons* are divided by the characters of the perianth into *Polypetalae*, *Campylotales*, and *Apetalae* or *Monochlamydeae*. These are subdivided into 164 orders. Several modifications of this system have been adopted, especially by continental European botanists, the most important of which is the distribution of the apetalous orders among the two other divisions. The total number of species of *dicotyledonous* plants now known is about 80,000, included under about 6,000 genera. See *exogen*.

His command of language was immense. With him died the secret of the old poetical dictation of England—the art of producing rich effects by familiar words.

Macaulay, Dryden.

Nothing but the charm of narrative had saved Ariosto, as Tasso had been saved by his dictation, and Milton by his style.

Lowell, Fielding.

2†. A word.

In dictions are first to be considered their etymology and conjugation. *Burgersdicius*, tr. by a Gentleman. = Syn. *Diction*, *Phraseology*, *Style*. *Diction* refers chiefly to the choice of words in any utterance or composition. *Phraseology* refers more to the manner of combining the words into phrases, clauses, and sentences: as, legal *phraseology*; but it also necessarily involves dictation to some extent. *Style* covers both and more, referring not only to the words and the manner in which they are combined, but to everything that relates to the form in which thought is expressed, including peculiarities more or less personal to the writer or speaker.

The book of Job, indeed, in conduct and dictation, bears a considerable resemblance to some of his [Milton's] dramas.

Macaulay, Milton.

The Book of Sophisms [in Aristotle's "Organon"] . . . still supplies a very convenient phraseology for marking concisely some of the principal fallacies which are apt to impose on the understanding in the heat of a viva voce dispute.

D. Stewart, The Human Mind, II. iii. § 3.

The genius of the great poet seeks repose in the expression of itself, and finds it at last in style, which is the establishment of a perfect mutual understanding between the worker and his material.

First used, it is said, by Joannes de Garlandia (died about A. D. 1250), the compiler of a *dictionarius*, a classified list of words. Exactly equiv. in etymological meaning are *vocabulary*, *lexicon*, and *word-book*.] 1. *n.*; pl. *dictionaries* (-riz). A book containing either all or the principal words of a language, or words of one or more specified classes, arranged in a stated order, usually alphabetical, with definitions or explanations of their meanings and other information concerning them, expressed either in the same or in another language; a word-book; a lexicon; a vocabulary: as, an English dictionary; a Greek and Latin dictionary; a French-English or an English-French dictionary. In the original and most usual

sense a dictionary is chiefly linguistic and literary, containing all the common words of the language with information as to their meanings and uses. In addition to definitions, the larger dictionaries include etymologies, pronunciation, and variations of spelling, together with illustrative citations, more or less explanatory information, etc. Special or technical dictionaries supply information on a single subject or branch of a subject: as, a dictionary of medicine or of mechanics; a biographical dictionary. A dictionary of geography is usually called a gazetteer.

What speech esteem you most? The king's, said I.

But the best words? O, Sir, the dictionary.

Pope, Donne Versified, iv.

A positive or judicial assertion; an authoritative saying.

Critical dicta everywhere current. M. Arnold.

In spite of Dr. Johnson's dictum, poetry is not prose, and . . . verse only loses its advantage over the latter by invading its province.

Lowell, Among my Books, 2d ser., p. 189.

The authoritative Native treatises on law are so vague that, from many of the dicta embodied by them, almost any conclusion can be drawn.

Maine, Village Communities, App., p. 393.

There is no error in maintaining that the voice is given us for speech, if only we do not proceed to draw from such a dictum false conclusions as to the relation between thought and utterance.

Whitney, Encyc. Brit., XVIII. 787.

2. In law, an opinion of a judge which does not embody the resolution or determination of the court, and is made without argument, or full consideration of the point, and is not the professed deliberate determination of the judge himself. Chief-Justice Folger.—3. In logic, that part of a modal proposition which consists of the proposition to which the modality is applied.

It is necessary that God be good. The dictum is that God be good, the mode, necessary.

Burgersdicius, tr. by a Gentleman.

Dictum de omni et de nullo (concerning every and none), the rule of direct syllogism that if all A is B and all B is C, then all A is C. Some logicians render this as comprising two dicta: the *dictum de omni*, that whatever is true of all is true of each, and the *dictum de nullo*, that whatever is true of none is false of each. The canon is given by Aristotle.—**Dictum of Kenilworth**, an award designed for the pacification of the kingdom, made between King Henry III. of England and Parliament in 1266, during the siege of Kenilworth. It is published among the statutes of the realm, I. 12.—**Dictum simpliciter**. See *simpliciter*.—**Obliter dicta**, legal dicta (def. 2) uttered by the way (*obiter*), not upon the point or question pending, as if turning aside for the time from the main topic of the case to collateral subjects. = Syn. 1. *Aphorism*, *Axiom*, *Maxim*, etc. See *aphorism*.

Dictyocysta (dik'ti-ō-sis'tā), *n.* [NL., < Gr. *diktyon*, a net, + *kystis*, bladder.] The typical genus of *Dictyocystidae*, containing pelagic free-swimming animalcules with a fenestrated silicious lorica and tentaculiform cilia. *D. cassisi* and *D. elegans* are examples. Ehrenberg.

Dictyograptus (dik'ti-ō-grap'tus), *n.* [NL., < Gr. *diktyon*, a net, + NL. *Graptus*.] A genus of widely distributed and important fossils, originally described by Eichwald under the name of *Gorgonia flabelliformis*, and later by Hall under that of *Dictyonema*, and by him at that time (1852) considered to be corals, having a structure similar to that of *Fenestella*. Later the name *Dictyograptus* was substituted for *Dictyonema*. This fossil has been considered by some as a plant, but is now referred to the graptolites, from which it differs but slightly, if at all. *Dictyograptus* is "one of the most charac-

teristic fossils of the primordial zone of Scandinavia" (Geikie), and is found in many localities in the shales of the Niagara group, from Rochester to the Niagara river.

dictynal (dik'ti-ō-nal), *a.* [As *dictyon-ine* + *-al*.] Same as *dictyonine*.

(Zittel), < Gr. *diktyon*, a net, + *-ina*.] A suborder of hexactinellid silicious sponges, whose parenchymal hexacts unite in a regular firm skeleton: contrasted with *Lyssacina*. The families *Farreidae*, *Euretidae*, *Mellitoniidae*, *Coscinoporidae*, *Tretodictyidae*, and *Meandrospongidae* compose the suborder.

Dictyophyllum (dik'ti-ō-fl'um), *n.* [NL., < Gr. *diktyon*, a net, + *φύλλον* = L. *folium*, leaf.] A genus of fossil ferns established by Lindley and Hutton, remarkable for its double system of nervation, consisting of a system of larger meshes inclosing another system of smaller ones, the whole bearing considerable resemblance to leaves of dicotyledonous plants. Hence some fossil leaves really belonging to the dicotyledons have, probably by mistake, been referred to this genus. Some authors are at present inclined to regard *Dictyophyllum* as a convenient name under which to place the description of fragments of doubtful character considered as belonging to the ferns. See *Idiophyllum* and *Phyllites*.

Dictyophyton (dik-ti-ōf'i-ton), *n.* [NL., < Gr. *diktyon*, a net, + *φυτόν*, a plant.] The name given by Hall to a genus of remarkable fossils of obscure affinities, which have been compared with algae of the family *Dictyotaceae*. It is also considered as being closely related to, or identical with, the genus *Uphanentia* of Vauvex. The latter genus exhibits itself in the form of circular or flabellate fronds, made up of ligulate, radiating and concentric bands or striae, which have the appearance of being interwoven like basketwork. With these flabellate forms are associated others which are conical or cylindrical, marked externally by cross striae which divide the surface into rectangular spaces, and sometimes covered with long tubercles arranged in vertical and transverse rows. These latter forms are those which Hall included under the generic name of *Dictyophyton*. They are found in the Chemung group (Devonian) in New York, and in the Waverly group (Lower Carboniferous) of Ohio.

Dictyoptera (dik-ti-ōp'tē-rā), *n. pl.* [NL., < Gr. *diktyon*, a net, + *πτερόν*, a wing.] A group of cursorial orthopterous insects, the cockroaches, *Blattidae* or *Blattina*, elevated to the rank of an order. Leach; Burmeister.

Dictyotaceae (dik'ti-ō-tā-sē-ā), *n. pl.* [NL., < Gr. *diktyon*, netted, latticed (< *diktyon*, a net), + *-aceae*.] An order of olive-brown algae with expanded membranous fronds. In their reproductive characters they are intermediate between the *Florideae* on the one hand and the *Fuaceae* and *Phaeosporae* on the other.

Dictyotææ (dik-ti-ō-tē-ā), *n. pl.* [NL., < Gr. *diktyon*, netted, latticed, + *-ææ*.] See *Dictyotaceae*. Same as *Dictyotaceae*.

They have the feet pedimanous—that is, the hind feet as well as the fore with an appposable thumb, and thus fitted for grasping; all the toes clawed excepting the hallux; the tail generally long, scaly, and prehensile; and the pouch in some forms complete, in others rudimentary or wanting. The dental formula is: 5 incisors in each upper, 4 in each lower half-jaw; 1 canine, 3 premolars, and 4 molars in each half-jaw. The vertebral formula is: cervical 7, dorsal 13, lumbar 6, sacral 2, caudal 19 or more. The family is confined to America, where it alone represents the division of marsupial mammals. The genus formerly covered nearly or quite all the marsupials. The species are terrestrial and arboreal, but not aquatic; the water-opossums being separated under the name *Chironectes*. The pouch is usually well developed, as in the best-known species, *D. virginiana*, the common opossum of the United States, but is rudimentary in some of the South American forms. See *Didelphyidae*, *opossum*.

The most recent investigations indicate that didymium is not an element, but a mixture of several different elements.

=Syn. 1. Die, *Expire, Decease, Perish.* To die is to cease to live, part with life, or become dead from any cause, and under any circumstances; it is the plainest and most direct of the words. *Expire* is often used as a softer word than *die*; it means to breathe out the life or emit the last breath. *Decease* is a euphemism, like *expire*, but is often an affection. *Perish* represents death as occurring under harsh circumstances of some sort, as violence or neglect; it emphasizes the idea of finality.

die², v. and n. An obsolete spelling of *dye*l.

die³ (dī), n.; pl., in the 1st sense, *dices* (dis); in the remaining senses, *dies* (diz). In def. 2 the word hardly admits of a plural. [The mod. sing. form *die* is due to the peculiar form of the pl., *dice*, ME. *dys*, etc. (see *dice*); the sing. would otherwise be **dee*, < ME. *dee*, a die, < OF. *de*, earlier *det*, pl. *dez*, F. *dé* = Pr. *dat* = Sp. Pg. It. *dado*, a die, cube, pedestal (whence E. *dado*, q. v.) (cf. ML. *dadus*, a die, after the Rom. forms), < L. *datum*, lit. what is given, but taken in the sense of 'what is cast or thrown', neut. of *datus*, pp. of *dare*, give, in many phrases used as equiv. to 'cast' or 'throw' (cf. G. *würfel*, a die, < *werfen*, throw). Thus *die*³ is a doublet of *date*¹, *datum*, and *dado*: see *date*¹.] 1. A small cube marked on its faces with spots numbering from one to six, used in gaming by being thrown from a box or the hand, the chance being decided by the highest number of spots turned up, and in several other ways. The numbers on opposite faces of a die always add up to 7, but otherwise there is no uniformity in the arrangement of the numbers. The number of dice used is either one, two, three, or five, according to the game.

Professed gamblers . . . will not trust to the determination of fortune, but have recourse to many nefarious arts to circumvent the unwary; hence we hear of *loaded dice*, and dice of the high cut.

Strutt, Sports and Pastimes, p. 404.

The roots, as in many other plants of the order, are very acrid and caustic, and the name *dumb-cane* has been given to *D. Seguine* in the West Indies, from its effect upon the speech when its root is bitten.

diegesis (dī-ē-jē'sis), n. [NL., < Gr. *διήγησις*, narration, < *διηγέσθαι*, set forth in detail, narrate, < *διá*, through, + *ηγέσθαι*, lead.] In *rhet.*, that part of an oration in which the speaker makes his statement of facts; the narration (which see).

See *residual*.—Dielectric capacity. Same as *specific inductive capacity* (which see, under *capacity*).

II. n. A substance through or across which electric force is acting. The walls of a Leyden jar; the intervening medium, solid, liquid, or gaseous, between the plates of a condenser; and the insulating sheath around the conductor of a telegraph-cable, are examples of dielectrics. Electric induction across a dielectric causes a stress in it which, if great enough, will produce rupture. The maximum intensity of this stress which the material can bear is called its *dielectric strength*. When the dielectric strength of the air between two clouds, or between a cloud and the earth, is unable to withstand the electric forces, a flash of lightning takes place. The fracture of stones in buildings, of trees, etc., in a thunderstorm are illustrations of the effect of excessive dielectric stress.

Until this subject [induction] was investigated by Faraday, the intervening non-conducting body or *dielectric* was supposed to be purely negative, and the effect was attributed to the repulsion at a distance of the electrical fluid. Faraday showed that these effects differed greatly according to the *dielectric* that was interposed.

the second of two contiguous vowels to indi-

cate that they are pronounced separately; the

same sign used for other purposes. The dieresis

is used most frequently over *e* preceded by *a* or *o*, in dis-

tinction from the diphthongs or digraphs *æ* and *œ*. In

Greek manuscripts these dots were frequently written

over *a* and *u* beginning a word or a syllable, thus serving

also to show that they did not form the close of a diph-

Diemenia reticularia.

thong (ai, et, oi, ui, av, ev, ou), and their modern use is an extension of this. The employment of the dieresis to mark the full pronunciation of the letters *ed*, as termination of the preterit and past participle (for instance, *praised*), though sometimes seen, is not established usage, the acute or grave accent being more common. Difference is the same that is spoken of many, which differ in forme and kinde, when the question is asked, What manner of thing it is, as when we say: What manner of thing is man? The first five words express the fact of unlikeness; *difference* and *distinction* apply also to that wherein the unlikeness lies, and *discrimination* to the act of making or marking a difference, and to the faculty of discerning differences. (See *discernment*.) *Distinction* applies also to the eminence conferred on account of difference. *Difference* is the most general, applying to things small or great, internal or external. *Distinction* is generally, but not always, external, and generally marks delicate differences: as, the distinction between two words that are almost synonymous. *Diversity*, by its derivation, is a great or radical difference, equal to going in opposite directions. *Dissimilarity* is unlikeness, generally in large degree or essential points. *Disparity* is inequality, generally in rank or age. *Disagreement* and *variance* are weak words by their original meaning, but through euphemistic use have come to stand for dissimilarity of opinion of almost any degree, and for the resulting alienation of feeling, or even dissension and strife.

But the relation of opposition is often lost in that of mere comparison, leading to the use of *to* instead of *from*. This use is regarded as colloquial or incorrect, and is generally avoided by careful writers.

Different to is, essentially, an English colloquialism; and, like many colloquialisms, it evinces how much stronger the instinct of euphony is than the instinct of scientific analogy. *F. Hall, Mod. Eng., p. 183.*

Equal currents passing through these coils in opposite directions produce no magnetic field in the center of the coil.

II. n. 1. In math.: (a) An infinitesimal difference between two values of a variable quantity. In the differential and integral calculus, if two or more quantities are dependent on one another, and subject to variations of value, their corresponding differentials are any other quantities whose ratios to one another are the limits to which the ratios of the variations approximate,

as these variations are reduced nearer and nearer to zero; but the differentials are commonly understood to be infinitesimal. (b) A logarithmic tangent.—2. See *interference*.

Diffraction Bands.

Thus, if a beam of monochromatic light is passed through a narrow slit and received on a screen in a dark room, a series of alternately light and dark bands or fringes is seen, which diminish in intensity and distinctness on either side of the central line; if white light is employed, a series of colored spectra of different orders is obtained. Similar phenomena of diffraction are obtained from diffraction gratings, which consist of a band of equidistant parallel lines (from 10,000 to 30,000 or more to the inch), ruled on a surface of glass or of polished metal; the spectra obtained by this means are called *interference* or *diffraction spectra*. They differ from prismatic spectra, since in them the colors are uniformly distributed in their true order and extent according to their difference in wave-length; while in the latter the less refrangible (red) rays are crowded together, and the more refrangible (blue, violet) are dispersed. Diffraction gratings are now much used, especially in studying the solar spectrum. The best gratings are ruled on speculum metal with a concave surface (often called *Rouland gratings*, after Professor Henry A. Rowland of Baltimore), and give an image of the spectrum directly, without the intervention of a lens.

The street lamps at night, looked at through the meshes of a handkerchief, show diffraction phenomena.

experiment, with the lower end plunged in mercury and the upper end closed with a porous plug; the rate of diffusion is determined from the rapidity with which the mercury rises in the tube as the diffusion of the gas goes on through the porous plug.

diffusion (di-fū'zhon), *n.* [= *F. diffusion* = *Pr. diffusio* = *Sp. difusión* = *Pg. difusão* = *It. diffusione*, < *L. diffusio(n-)*, < *diffundere*, pp. *diffusus*, diffuse: see *diffuse*, *v.*] The act of diffusing, or the state of being diffused. (a) The gradual and spontaneous molecular mixing of two fluids which are placed in contact one with the other. It takes place without the application of external force and even when opposed by the action of gravity. It is explained by the motion and mutual attraction of the molecules of the two fluids. Diffusion is most rapid and marked between gases, but is also an important phenomenon of liquids. See *diffusion of gases and diffusion of liquids*, below.

The process of diffusion is one which is continually performing an important part in the atmosphere around us. Respiration itself, but for the process of diffusion, would fail in its appointed end.

W. A. Miller, *Elem. of Chem.*, I. iii, § 3.

(b) A scattering, dispersion, or dissemination, as of dust or seed, or of animals or plants.

After a certain time a homogeneous mixture is obtained, even if the heavier gas is placed below. When separated by a porous diaphragm the relative rate of diffusion can be measured (see *diffusimeter*); it is found to be the more rapid with the lighter gas.—**Diffusion of heat**. (a) A phrase employed to express the modes by which the equilibrium of heat is effected, viz. by conduction, radiation, and convection. The term is also used, like *diffusion of light* (see *light*), to describe the irregular reflection or scattering of the incident heat (and light) from the surface of a body not perfectly smooth. (b) Conduction of heat.—**Diffusion of liquids**, the diffusion through each other which occurs when two liquids that are capable of mixing, such as alcohol and water, are placed in contact, even in spite of the action of gravity. It is closely related to the phenomena of exosmosis and endosmosis (which see), which take place when the liquids are separated by a porous diaphragm. See also *diaphyresis*.—**Diffusion of taxes**, the theory that the community as a whole must bear the burden of any tax, no matter upon what commodity or persons it is originally levied. This theory rests on the assumption of perfect competition.—**Diffusion tube**, an instrument for determining the rate of diffusion for different gases.—**Syn.** Spread, circulation, expansion, dissemination, distribution.

See *cerebellum*.—**Digastric muscle**. See *muscle*.—**Digastric nerve**, a branch of the facial nerve, supplying the posterior belly of the digastric muscle.

II. n. A muscle of the lower jaw: so called because in man it has two bellies. In its generalized condition it is a principal depressor of the lower jaw, opening the mouth and antagonizing the temporal and masseteric muscles. It arises from the back part of the skull, and is inserted into the mandible. In man and many other animals (though not in most) it becomes digastric or double-bellied, the intervening tendon being bound by an aponeurotic loop to the hyoid bone, and the muscle thus becoming an elevator of the hyoid as well as a depressor of the jaw. It arises from the digastric groove of the mastoid, and is inserted into the symphysis menti. With the lower border of the jaw its two bellies, which meet at an angle, bound the surgical triangle of the neck known as the submaxillary space.

It is called in this form (first described in 1681) *Papin's digester*, from its inventor, Denis Papin, a Frenchman. The principle is applied in other forms, and by it various useful products are obtained on a large scale from animal carcasses unfit for other use. In other kinds of digesters the operation is chemical, and does not imply the extreme pressures employed in that above described. Thus, in one kind, nut-galls or other vegetable products are placed in a vessel and saturated with ether; the volatile extract falls in minute drops into a closed vessel below, which is connected by means of a pipe with the top of the upper vessel to prevent the escape of the ether. See *rendering-tank*.

2. The physiological process of converting the food from the state in which it enters the mouth to that in which it can pass from the alimentary canal into the blood-vessels and lymphatics. The principal features of the process, apart from the comminution of the food, are the conversion of starch into sugar and of proteids into peptones, and the emulsifying of the fats. These changes are effected by the action of soluble ferments furnished by the salivary glands, the gastric glands, the pancreas, and the intestinal glands. The bile is also of service, especially in the emulsifying of the fats.

chiefly upon roots dug from the ground. Collectively called *Digger Indians*.

Among all these Indians the most miserable are the root-diggers, who live almost entirely on the scanty roots of plants which are found in the ravines or plains. These poor wretches suffer all the hardships of hunger and want. They are compelled to spend two thirds of the year among the mountains, with no other resource than a little fish and roots. When both these provisions fail, it is impossible to picture the wretched state of these pariahs of the wilderness. Yet they are not downcast; they are ever cheerful, and endure their suffering with dignity. They are open and sociable with strangers and perfectly honest in their transactions.

A finger or toe; in the plural, the third segment of the hand (manus) or foot (pes), consisting of the fingers or toes, each of which has usually three, sometimes two, occasionally one, and rarely more than three, joints or phalanges. The digits are specified by qualifying terms: as, the index *digit*, the forefinger; the middle *digit*, etc. The inner digits of the hand and foot, respectively, when there are five, as in man, are the thumb and great toe, or the pollex and hallux. See cuts under *foot* and *hand*. In common use *digit* is applied only to a finger.

dilemma (di- or di-lem'ā), *n.* [= F. *dilemme* = Sp. *dilema* = Pg. It. *dilemma* = D. G. Dan. Sw. *dilemma*, < LL. *dilemma*, < Gr. *δύλωμα*, a conclusion from two premises, < *δι-* + *λῆμμα*, a proposition, assumption: see *lemma*. Not "an argument in which the adversary is 'caught between' (*διαλαμβάνεται*) two difficulties," nor derived from *διαλαμβάνεσθαι*, be caught between.]

1. A form of argument in which it is shown that whoever maintains a certain proposition must accept one or other of two alternative conclusions, and that each of these involves the denial of the proposition in question. The alternatives are called the *horns* of the dilemma, which is also called a *horned syllogism*. The argument is also called a dilemma, in a looser sense, when the number of such horns exceeds two. The dilemma originated in rhetoric, and was not noticed by logicians before the revival of learning; consequently there has been some dispute as to its logical definition and analysis. The standard example (from *Aulus Gellius*) is as follows: Every woman is fair or ugly; it is not good to marry a fair wife, because she will flirt; it is not good to marry an ugly wife, because she will not be attractive; therefore, it is not good to marry at all. The essential peculiarity of this reasoning is that it involves the principle of excluded middle, the falsity of which would leave ordinary syllogism intact. Logicians, however, have made the dilemma a matter of form of expression, saying that the above argument, for instance, is not a dilemma as long as the first premise reads as above, but that it becomes one if that premise is put in this form: If it is good to marry, it is good to marry a fair wife, or it is good to marry an ugly wife. They have at different times recognized the following forms as dilemmas or as parts of dilemmas, for many logicians hold that a dilemma consists of three syllogisms: (1) *Simple constructive dilemma*: If A, then C; if B, then C; but either B or A; hence, C. (2) *Simple destructive dilemma*: If A is true, B is true; if A is true, C is true; B and C are not both true; hence, A is not true. (3) *Complex constructive dilemma*: If A, then B; if C, then D; but either A or C; hence, either B or D. (4) *Complex destructive dilemma*: If A is true, B is true; if C is true, D is true; but B and D are not both true; hence, A and C are not both true. The importance of the kind of reasoning now called dilemma was first strongly insisted upon by the Stoics. Nevertheless, in the Stoical terminology a dilemma is opposed to a *monolemma*, as a conclusion from two premises. This was the origin of the word, and it is only later that it is met with in the modern sense.

Dilemma is an argument made of two members, repugnant one to another, wherof whichsoever thou grantest, thou art by and by taken. *Blundeville*, *Logic*, v. 27.

2. A difficult or doubtful choice; a state of things in which the alternatives appear to be equally bad or undesirable.

diluvianism (di- or di-lū'vi-an-izm), *n.* [*< diluvian + -ism.*] A geological theory which is largely based on the supposition of the former occurrence of a universal deluge. In the early history of geology the deluge played an important part, and many leading facts were explained by reference to it.

E. deluge, q. v.), < diluere, wash away: see dilute.*] **1.** A deluge or an inundation; an overflowing.—**2.** Coarse detrital material, wherever found: a term introduced into geology in consequence of a general belief in the past occurrence of a universal deluge. Finer materials, usually occupying the lower parts of valleys, and occurring especially along the courses of great rivers, were called *alluvium* (which see). In the use of the words *diluvium* and *alluvium* (*diluvial, alluvial*) there is an obscure recognition of a fundamental fact in geology, namely, that rivers have been gradually diminishing in volume, a condition which necessarily connects itself with diminished erosive power. But the idea of a catastrophic period of diluvial action, preceded and followed by repose, such as lies at the base of the belief in the deluge, is no longer in vogue, and the word *diluvium* has become almost obsolete except among German geologists.

dimaris, dimatis (dim'a-ris, -tis), *n.* [An artificial term.] The mnemonic name of that mood of the fourth figure of syllogism which has affirmative propositions for its premises, one universal, the other particular. The oldest name for this mood seems to have been *dimatis*, of which *dimatis* is an improvement, and *dimaris* is now most commonly in use. The following is an example of this mood: Some commendable actions are recognized by the political economists; but every action recognized by the economists is a selfish one; therefore, some selfish actions are commendable. The letters of the word have the following significations: *i*, a, and *i* show the quantity and quality of the propositions; *d*, that the reduction is to *darti*; *m*, that the premises are transposed in reduction; *s*, that the conclusion of the reduction is to be simply converted. See *A1, 2 (b)*, and *conversion, 2*.

Dimocodon (di-mō'kō-don), *n.* [NL, < Gr. *di-*, two-, + *μῆκος*, length, + *ὄδον*, Ionic for *ὄδους* = *E. tooth*.] A notable genus of Japanese moles, of the family *Talpidae*, related to *Urotrichus*, having teeth of two lengths (whence the name), and the anterior incisors broad and spatulate. The type-species is *D. pilosioris*, having the general aspect of *Urotrichus talpoides*; tail vertebrae half the length of the head and body, soles and palms entirely scaly, and snout pilose. Originally misspelled *Dymecodon*. F. W. True, 1886.

dimension (di-men'shōn), *n.* [OF. *dimension*, F. *dimension* = Pr. *dimensio* = Sp. *dimension* = Pg. *dimensão* = It. *dimensione* = D. *dimensio* = G. Dan. Sw. *dimension*, < L. *dimensio* (*n.*), a measuring, extent, dimension, diameter or axis, < *dimetiri*, pp. *dimensus*, measure off, measure out (cf. pp. *dimetien* (*t.*), as a noun, diameter), < *di-* for *dis-*, apart, + *metiri*, measure: see *measure*.] 1. Magnitude measured along a diameter; the measure through a body or closed figure along one of its principal axes; length, breadth, or thickness. Thus, a line has one dimension, length; a plane surface two, length and breadth; and a solid three, length, breadth, and thickness. The number of dimensions being equal to the number of principal axes, and that to the number of independent directions of extension, it has become usual in mathematics to express the number of ways of spread of a figure by saying that it has two, three, or *n* dimensions, although the idea of measurement is quite extraneous to the fact expressed. The word generally occurs in the plural, referring to length, breadth, and thickness.

So do those skills, whose quick eyes do explore
The just dimension both of earth and heaven.

Sir J. Davies, *Dancing*, st. 95.

A dark

Illimitable ocean, without bound,
Without dimension, where length, breadth, and height,

Streaking the ground with sinuous trace.

Milton, P. L., vii, 480.

Hence—2. A mode of linear magnitude involved (generally along with others) in the quantity to which it belongs. (a) In *alg.*, a variable factor, the number of dimensions of an expression being the number of variable factors in that term for which this number is the largest. (b) In *phys.*, a linear measure of length, time, mass, or any kind of quantity regarded as a fundamental factor of the quantity of which it is a dimension. If *M*, *L*, *T*, are the units of mass, length, and time, the dimensions of a velocity are said to be *LT⁻¹*, or one dimension of length and minus one of time; those of an acceleration are said to be *LT⁻²*; those of a momentum, *MLT⁻¹*; those of a force, *MLT⁻²*; those of a quantity of energy, *MLT⁻²*; those of the action of a moving system, *ML²T⁻²*; those of a horse-power, *ML²T⁻²*; those of a pressure, *ML⁻¹T⁻²*; those of a density, *ML⁻³*; etc.

We are justified in considering the range, the flat pencil, and the axial pencil, as of the same dimensions, since to every point in the first corresponds one ray in the second and one plane in the third.

=Syn. Obscurity, Gloom, etc. See darkness.

di molto (dē mōl'tō), [*It. adv. phrase: di, < L. de, of; molto, < L. multus, much: see multi-.*] In music, very much: as, *allegro di molto*, very fast.

dimorph (di'mōrf), *n.* [= *F. dimorphe* = *It. dimorfo* (chiefly adj.), *< NL. dimorphus, < Gr. di-morphos, having two forms, < di-, two-, + morph-, form.*] One of the forms assumed by a dimorphous substance: as, calcite is a *dimorph*.

Dimorpha (di-mōrf'f), *n.* [*NL., fem. of dimorphus: see dimorph.*] 1. A genus of hymenopterous insects. *Jurine*, 1807.—2. A genus of mollusks. *Gray*, 1840.—3. A genus of birds. *Hodgson*, 1841.

dimorphic (di-mōrf'f), *a.* [*As dimorph + -ic.*] 1. Existing in two distinct forms; dimorphous. See *dimorphous*.

A large proportion of the trees of temperate climates bear only flowers thus *dimorphic*.

Nat. Hist. Rev.

2. Pertaining to dimorphism; exhibiting or characterized by dimorphism, in any sense of that word.

Dimorphic females among insects have been observed. . . . In these cases, as a rule, one of the female forms is more nearly related in form and color to the male, . . . in other cases the differences are more connected with climate and season, and also affect the male.

Claus, *Zoology* (trans.), i. 155.

dimorphism (di-mōrf'fizm), *n.* [= *F. dimorphisme* = *It. dimorfismo*; as *dimorph + -ism*.] 1. The property of assuming or of existing under two distinct forms. Specifically—2. In crystal, the property of assuming two distinct crystalline forms not derivable from each other, as by crystallization. Thus, sulphur assumes one form when crystallizing at a high temperature, and another wholly different when becoming solid at the ordinary temperature. Hence, the same chemical substance may form two or more distinct mineral species. Carbon in one form is the diamond, in another graphite, etc.

According to the observation of Pasteur, instances of *dimorphism* usually occur when the two forms are nearly upon the limit of their respective systems.

W. A. Miller, *Elem. of Chem.*, i. iii. § 4.

3. In bot., the occurrence of two distinct forms

Dimorphism in Plants.

1. Submerged and floating leaves of *Cabomba*. 2. Disk- and ray-florets of *Aster*.

of flowers or other parts upon the same plant, or upon plants of the same species.

Dimorphism in flowers may affect the perianth only, and not the *ovary* or essential organs; or there may be two kinds of flowers as respects these also, but with no reciprocal relations, as in cleistogamous *dimorphism*; or of two kinds essentially alike except in stamens and pistil, and these reciprocally adapted to each other, which is heterogamous *dimorphism*, or when of three kinds, tri-morphism.

A. Gray, *Struct. Bot.*, p. 225.

4. In zool., difference of form, structure, size, coloration, etc., between individuals of the same species. Sexual *dimorphism* is the rule in the animal

kingdom: and differences between the male and female other than in the sexual organs, as well as constant differences between individuals of each sex, without reference to sex, are instances of *dimorphism*.

Dimorphism is thus seen to be a specialized result of variation, by which new physiological phenomena have been developed.

A. R. Wallace, *Nat. Select.*, p. 158.

The phenomena of *dimorphism* and polymorphism in the same species, and the sexual differences which have been developed in animals originally hermaphrodite, may be quoted as important evidence of the extensive influence of adaptation. . . . The numerous cases of *dimorphism* and polymorphism in either sex of the same species should be regarded from the same point of view.

Claus, *Zoology* (trans.), i. 154.

5. In philol., the existence of a word under two or more forms called doublets; thus, *dent* and *dint*, *fat* and *vat*, *church* and *kirk*, exhibit *dimorphism* developed within English, and *card* and *chart*, *choir*, *quire*, and *chorus*, *reason*, *ration*, *ratio*, etc., exhibit *dimorphism* arising outside of English.

Where it [bifurcation] is produced by a foreign word coming into English in different ways, it has been called *dimorphism*: *ration*, *reason*.

F. A. March, *Anglo-Saxon Grammar*, p. 28.

Dimorphodon (di-mōrf'fō-don), *n.* [*NL., < Gr. di-morphos, of two forms (see dimorph), + dōn, Ionic form of dōnēs (dōnēr-) = E. tooth.*] A genus of extinct pterosaurian reptiles, or pterodactyls: so called from the fact that their teeth were of two kinds, the anterior long, the posterior mostly very short. The tail was long, and the other characters mostly as in *Rhamphorhynchus*; the metacarpus was comparatively short, and the ends of the toothless jaws were probably sheathed in horn.

dimorphous (di-mōrf'fus), *a.* [*< NL. dimorphus, < Gr. di-morphos, having two forms: see dimorph.*] Existing in two forms; dimorphic: specifically applied in crystallography to a substance whose crystals occur in two distinct forms. Thus, calcium carbonate crystallizes in the rhombohedral form as calcite, and in the orthorhombic as aragonite. See *dimorphic*.

Bodies capable of . . . assuming two forms geometrically incompatible are said to be *dimorphous*.

W. A. Miller, *Elem. of Chem.*, i. iii. § 4.

It is not unlikely that the Guinea worm, . . . which infests the integument of Man in hot climates, may answer to the hermaphrodite state of a similarly *dimorphous* Nematode.

Huxley, *Anat. Invert.*, p. 552.

The principal meal of the day, taken at midday or later, even in the evening. In medieval and modern Europe the common

practice, down to the middle of the eighteenth century, was to take this meal about midday, or in more primitive times even as early as 9 or 10 A. M. In France, under the old régime, the dinner-hour was at 2 or 3 in the afternoon; but when the Constituent Assembly moved to Paris, since it sat until 4 or 5 o'clock, the hour for dining was postponed. The custom of dining at 6 o'clock or later has since become common, except in the country, where early dinner is still the general practice. See extract under *dinner-hour*.

dinner-hour (din'er-our), *n.* The hour at which dinner is taken; dinner-time. See *dinner*.

The Court dinner-hour, in the reign of George III., was at the Hanoverian hour of four o'clock. During the reign of George IV. it gradually crept up to six o'clock, and finally became steady at the Indian hour of seven, and so remained until the reign of Her Most gracious Majesty, when the formal Court dinner-hour became eight o'clock. These innovations on the national hours of meals did not meet the approval of the medical faculty, and in consequence a dinette at two o'clock was prescribed. This has ever since been the favourite Court meal, being in reality a substantial hot repast, which has exploded the old-fashioned luncheon of cold viands.

They were characterized by an enormous development of the legs and pelvis in comparison with the rest of the skeleton, a ratite or flat sternum, and rudimentary wings. Dinosauria (dī-nô-sâ-ri-â), *n. pl.* [NL., less prop. *Deinosauria*, < *Dinosaurus*, *q. v.*] A group of extinct Mesozoic reptiles, mostly of gigantic or colossal size. They were characterized by distinctly socketed teeth; generally flat or slightly cupped vertebrae, some of which were opisthocelous; a sacrum of four or more vertebrae; numerous caudal vertebrae; a structure of the skull in many respects intermediate between the crocodilian and lacertilian types; ambulatory or saltatory limbs; fore limbs reduced and not known to have had clavicles; and hind limbs usually disproportionately developed, and with the pelvis presenting a series of modifications tending toward the characters of birds, on which account the group is also called *Ornithoscelidia* (which see). The ornithic structure of the legs is best seen in the smaller genera, such as *Compsognathus*; it is exhibited in the presence of a cuneal crest, the reduction of the distal end of the fibula, the disposition of the distal end of the tibia, and the relations of the astragalus. In some genera there was a bony dermal armor, in some cases developing great spines. The *Dinosauria* were a polymorphic as well as an extensive group, the limits of which are not settled, owing to the wide range of variation presented by them. They ranged in size from that of the huge iguanodon down to about two feet. By some they are supposed to have included the remote ancestors of birds; others find in them features that recall mammals, especially pachyderms. The order is by some divided into *Dinosauria* proper and *Compsognathia* (which see); it is sometimes ranked as a subclass of *Reptilia*, and divided into *Sauropoda*, *Stegosauria*, *Ornithopoda*, *Theropoda*, and *Halopoda*.

great size, related to the elephants, mammoths, and mastodons. It had (?) incisors in the upper and 2 in the lower jaw, no canines, 2 premolars and 3 molars in each half of each jaw—all in position at once, the premolars replacing milk molars as usual in diphyodont mammals—and enormous lower incisors, turned down or away from the mouth, the end of the under jaw being modified to correspond. There are several species, from the Miocene of Europe and Asia, the best-known of which is *D. giganteum*, from Eppelsheim near Mainz, estimated to have been about 13 feet long.

ida. It has a rosette of root-leaves, from which rises a naked scape bearing a corymb of rather large white flowers. The leaves have a dilated petiole and a slightly stalked 2-lobed lamina or appendage with three very delicate hairs and a fringe of stout marginal bristles on each lobe. The hairs are remarkably irritable, and when touched by a fly or other insect the lobes of the leaf suddenly close on the insect and capture it. This is followed by the copious secretion of an acid liquid for the digestion of the prey, and by its absorption. This may be repeated several times by the same leaf.

The most important of these festivals, in the historic period, were those of Attica, which were four in number, celebrated annually: the *Laurai* or *Lesser Dionysia*, the *Lenaea*, the *Anthesteria*, and the *Dionysia in the City*, or *Greater Dionysia*. The Lesser Dionysia were a vintage-festival, celebrated through the rural demes in the month of Posideon (December), with universal merriment and freedom from restraint, extended even to slaves. Plays were performed during this festival, and from its characteristic songs and jests comedy was developed. The Greater Dionysia were observed at Athens in the second half of March, with a grand procession, a set chorus of boys, and the production in competition at the expense of the state, in the Dionysiac theater, in honor of the god, of the comedies and tragedies of which those surviving constitute our most precious treasures of ancient literature. See *Bacchus*, *Lenaea*, *Anthesteria*, *choragic*, and *choragus*.

Dionysiac (di-ō-nis'i-ak), *a.* [< L. *Dionysiacus*, < Gr. *Διονυσιακός*, < *Διονυσία*, Dionysia: see *Dionysia*, *Dionysus*.] In Gr. myth., of or pertaining to the festivals called Dionysia, in honor of Dionysus or Bacchus, the god of wine; *Bacchic*.

It [the Bacchae] is a magnificent play, alone among extant Greek tragedies in picturesque splendour, and in that sustained glow of *Dionysiac* enthusiasm to which the keen irony lends the strength of contrast. *Enegy*, Brit., VIII. 678.

The stem is very short and stout, with a crown of large, rigid, and spine-tipped pinnate leaves. The female cone is of the size of a child's head, each scale bearing two seeds as large as chestnuts. The seeds of *D. edule* yield a kind of arrowroot. Also *Dion*.

Dioonites (di-ō-ō-ni'tēz), *n.* [NL., < *Diōn* + *-ites*.] The generic name of a fossil plant belonging to the ceyads, occurring in numerous localities in the Triassic and Jurassic of Europe. The genus *Dioonites*, as instituted by Bornemann, consists largely of species previously assigned by authors to *Pterophyllites*.

Diophantine (di-ō-fan'tin), *a.* [LL. *Diophantus*, Gr. *Διόφαντος*, a proper name, + *-ine*.] Of or pertaining to Diophantus of Alexandria, a celebrated Greek mathematician, who flourished in the fourth century.—**Diophantine analysis**, indeterminate analysis: a method of solving Diophantine problems, namely, of solving indeterminate algebraic equations, the solutions being rational numbers. The method consists in introducing an equation involving an indeterminate coefficient, in such a way that the square of one of the unknowns may be eliminated. It therefore depends upon the ingenuity and experience of the calculator. The following is an example: Required to separate a given square number N^2 into the sum of two squares. Let x^2 be one of these squares, and let the root of the other be $az - N$, where a is indeterminate. Then, the sum of the two squares will be $(1 + a^2)x^2 - 2aNx + N^2$. Since this is equal to N^2 , we have $(1 + a^2)x^2 = 2aN$, or $x = 2aN / (1 + a^2)$, which is rational.

It occurs in prismatic crystals, of a vitreous luster, and of a pale-green or a greenish- or yellowish-white color. Fine specimens come from the Mussa Alp, in the Ala valley in Piedmont. Also called *alalite* and *missite*.

All the known species are from tropical regions of the old world. 2. A genus of turbellarian worms.

A species of *Diopsis*.

dioptrase (di-op'tas), *n.* [F. *dioptrase*, < Gr. *diá*, through, + *optraia*, later form of *opsis*, view; cf. *optrázein*, be seen.] Emerald copper ore; silicate of copper, a translucent mineral, occurring crystallized in six-sided prisms.

View the asperities of the moon through a *dioptrick* glass, and venture at the proportion of her hills by their shadows. Dr. H. More, Antidote against Atheism, ii. 12.
2. Pertaining to dioptries, or the science of refracted light.

These *dioptric* images, when formed by lenses free from Spherical and Chromatic aberration, are geometrically correct pictures. W. B. Carpenter, Micros., § 157.

Dioptric system, in lighthouses, a mode of lighting in which the illumination is produced by a central lamp, the rays from which are transmitted through a combination of lenses surrounding it. Also called the *refracting system*.

II. *n.* A unit of refractive power of a lens (or inverse focal length), equal to unity divided by a meter. The numerical measure of the power of a lens expressed in dioptries is the ratio of one meter to the focal length of the lens, the latter being measured positively in the direction away from the source of parallel rays entering the lens; so that a convex lens with a focal length of half a meter would have a power of 2 dioptries, and a concave lens with a focal length of 250 millimeters would have a power of -4 dioptries.

Owing principally to differences in the length of the inch in various countries, this method (the inch being used as the unit) had great inconveniences, and is now giving place to a universal system, in which the unit is the refractive power of a lens whose focal length is one metre. This unit is called a *dioptric* (usually written "D").

Encey. Brit., XXII. 373.
dioptrical (di-op'tri-kal), *a.* Same as *dioptric*.
dioptrically (di-op'tri-kal-i), *adv.* By refraction.

And now that it has been shown that these images are not formed dioptrically, but are the result of numerous "diffraction-spectra," it is impossible to entertain the same confidence as before. W. B. Carpenter, Micros., § 277.

dioptrics (di-op'triks), *n.* [Pl. of *dioptric* (see -ics), after Gr. *dioptrika*, the science of dioptries.] That part of optics which treats of the refraction of light passing through different media, as air, water, or glass, and especially through lenses. The term is now not much used by scientific writers, the phenomena to which it refers being treated under the general head of *refraction* (which see). See also *lens*, *light*, and *optics*. Also called *anacastics*.

diorama (di-ô-râ-mâ), *n.* [< Gr. as if **diôrapa*, < *diôrap*, see through, < *diá*, through, + *ôrap*, see. Cf. *panorama*.] 1. A spectacular painting, or a connected series of paintings, intended for exhibition to spectators in a darkened room, in a manner to produce by optical illusions an appearance of reality. The paintings are so executed and arranged that a variety of effects may be induced by varying the direction, intensity, and color of the light; one of the most notable of these effects coming from light transmitted through the picture itself, which is painted in transparent coloring on a thin fabric. Different scenes may be painted on the two faces of the fabric, and a change from one to the other may be made by altering the source of the illumination. A daylight scene may be thus changed with wonderful realism to one by moonlight, or a desert place may become all at once peopled by a busy crowd. The diorama was devised in 1822 by Daguerre (the chief inventor of photography) and Boutton.

2. A building in which dioramic paintings are exhibited.

dioramic (di-ô-ram'ik), *a.* [< *diorama* + -ic.] Pertaining to or of the nature of a diorama.

To eat things sacrificed to idols is one mode of idolatry; but, by a prophetic diorism, it signifies idolatry in general. Dr. H. More, Epistles to the Seven Churches, p. 72.

2. In math., a statement of the conditions under which the problem to which it belongs is soluble.

dioristic, dioristical (di-ô-ris'tik, -ti-kal), *a.* [< Gr. *diôristikos*, distinctive, < *diôriscein*, distinguish: see *diorism*.] Distinguishing; defining. [Rare.]

Ye are not so pure and clean as ye ought to be, and free from the lusts of the flesh; which vice is here noted by Nicolaitism dioristically, as idolatry in general before by eating things sacrificed to idols.

Dr. H. More, Epistles to the Seven Churches, p. 72.

Diorite consists essentially of a crystalline-granular aggregate of a trichlinic feldspar and hornblende, in very varying proportions, with which are frequently associated magnetite and apatite, and sometimes mica. This rock has usually a thoroughly crystalline structure. Many of the rocks called by the name of *diorite* are, in all probability, altered basalts; some, however, may have resulted from the alteration of andesites, and even of gabbros. In the case of diorite, the alteration has proceeded further than it has in the diabases and melaphyres. See *greenstone* and *diabase*.

dioritic (di-ô-rit'ik), *a.* [< *diorite* + -ic.] Pertaining to or of the nature of diorite.

(rarely in sing. *Διόσκορος*), < *Διός*, gen. of *Zeús*, Zeus, + *κόρος*, Ionic *κόρος*, a son, a boy, lad.] In Gr. myth., the twin sons of Zeus and Leda, Castor and Polydeuces or Pollux, warrior gods, and tutelary protectors of sailors. At a comparatively late date the Dioscuri were partly confused with the Cabiri.

To the *Dioscuri*, who always retained very much of their divine nature, belongs a perfectly unblemished youthful beauty, an equally slender and powerful shape, and, as an almost never-failing attribute, the half-oval form of the hat, or at least hair lying close at the back of the head, but projecting in thick curls around the forehead and temples. C. O. Müller, Manual of Archæol. (trans.), § 414.

Zeus's wheat: *Διός*, gen. of *Zeús*, Zeus (see *Zeus*, deity); *πύρος*, wheat.] A large genus of trees and shrubs, of the natural order *Ebenaceae*, natives of the warmer regions of the world, but belonging for the most part to Asia and Mauritius.

Flower and Fruit of Persimmon (*Diospyros Virginiana*).

Of the 150 species, only two are American, of which one is the common persimmon of the United States, *D. Virginiana*, sometimes called *date-plum*. The wood is hard and heavy, and many species yield woods that are valuable for carving, furniture-making, etc. Ebony is the heart-wood of several species, the best and most costly with the blackest and finest grain, being obtained from *D. reticulata* of Mauritius and *D. Ebenus* of Ceylon. *D. quercifolia* of Ceylon yields calamander-wood, and *D. Kurzii* the marble-wood of the Andaman islands. *D. Lotus* of southern Europe has been supposed to be the lotus of the ancients, but its fruit is hardly eatable. It is used as a remedy for diarrhoea. The fruits of most of the species are excessively astringent when immature, owing to the amount of tannic acid which they contain.

It is not infrequently followed by more or less extended paralysis. The air-passages of the head are the most frequent seat of the diphtheritic membrane, although it may appear on other mucous surfaces and in wounds. The disease is very frequently fatal, and its ravages are extended by filth. Also *diphtheritis*.

In uttering a proper diphthong both vowels are pronounced; the sound is not simple, but the two sounds are so blended as to be considered as forming one syllable, as in *joy*, *noise*, *bound*, etc. An "improper" diphthong is not a diphthong at all, being merely a collocation of two or more vowels in the same syllable, of which only one is sounded, as *ea* in *breach*, *eo* in *people*, *ai* in *rain*, *au* in *beau*. (See *diagraph*.) In Greek grammar, a proper diphthong is a diphthong the first vowel of which is short; an improper diphthong, a diphthong the first vowel of which is long. The proper diphthongs are *αι*, *ει*, *οι*, *αυ*, *ευ*, *οι*; the improper, *αι*, *ηι*, *ου*, *ωι* (commonly written *ε*, *η*, *ο*; see *iota subscript*, under *subscript*), *ηυ*, *ωυ*. An improper diphthong not usually distinguished as such is *αι*, as in *αἶψα*, *Επὶ αἶψα*. Some include *υι* in this class, and some limit the term to *ε*, *η*, *ο*.

Whether there were any true diphthongs in Old English, and if not, when they were introduced, is a question which cannot now be answered.

See *homocercal*, *hypural*, *heterocercal*.

I. a. Having two sets of teeth, as a mammal; growing in two sets, as teeth: applied both to the system of dentition and to the animals which have such a system: opposed to *monophodont* and *polyphyodont*. See *II*.

In the Marsupialia the *diphyodont* condition is in a rudimentary stage, for it is confined to one tooth only on either side of the jaw.

Gegenbaur, Comp. Anat. (trans.), p. 552.

II. n. A mammal which has two sets of teeth. Most mammals have a definite set of milk-teeth which are deciduous, and are displaced and replaced by a permanent set. The latter, as a rule, differ both numerically and otherwise from the former, particularly in the appearance of true molars, which are lacking in the milk-dentition. Thus, in a child there are 20 teeth, none of them molars proper; in the adult there are 32, an increase of three molars above and below on each side.

diphyzooid (dif'i-ō-zō'oid), *n.* Same as *diphyzooid*.

diphysitism (dif'i-si-tizm), *n.* [*< diphysite + -ism*.] In theol., the doctrine of two distinct natures in Christ, a divine and a human, as opposed to *monophysitism*. According to the usual view, these two natures coexist in one person, whereas the Nestorians affirm the existence of a distinct person for each nature. Also improperly *diphysitism*.

diphyzooid (dif-i-zō'oid), *n.* [*< Gr. διφυής*, of double form (see *Diphyes*), + *ζοοιδ*.] A repro-

ductive zooid of the oceanic hydrozoans of the order *Calycephora*, detached and free-swimming by means of its nectocalyx, representing the complex distal set of appendages. Also *diphyzooid*.

The distal set of appendages [in the *Calycephora*] is the oldest, and as they attain their full development, each set becomes detached, as a free-swimming complex *diphyzooid*. In this condition they grow and alter their form and size so much that they were formerly regarded as distinct genera of what were termed monogastric *Diphydes*.

Huxley, Anat. Invert., p. 131.

Dipina (di-pī'nā), *n. pl.* Same as *Dipodidæ*.

A, B. *Diphys zooids* (*Sphenoides*), lateral and front views. C. *Diphys zooid* of *Abyla* (*Cuboides*). a, c, prophylls, reproductive organ; b, hydranth; c, phyllocyst, with its process, a, a *D. Free Gonophore*, its manubrium, a, containing ova. (All enlarged.)

being twice active, with an intervening period of rest. It occurs in the zoospores of certain genera of *Saprolegnia*, in which the zoospores escape without cilia from the sporangium, and come to rest in a cluster, each forming a cell-wall. After some hours of rest the protoplasm of each spore escapes from its cell-wall, acquires cilia, and enters upon a period of active movement.

diplanetian (dip-lan-tid'i-an), *a.* [*Gr.* διπλός, double, + ἀντί, against, + εἶδος, form, image.] Showing two images, one reversed and the other direct: applied to a telescope proposed in 1773 by Jeaurat, to be used in taking transits, the coincidence of the two images serving in place of a transit over an illuminated wire. The difficulties of the execution of such an instrument are, however, far greater than those of illuminating a wire.

It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side toward the object. So long as the object has not reached the meridian, the image produced by that portion of the rays reflected directly from the glass surface, and that produced by the rays transmitted through the glass to the silvered side, reflected from it to the other, and thence through the glass, are not coincident, but gradually approach as the sun or star approaches the meridian, until they exactly coincide at the instant the center of the object is on the meridian; then an eye stationed at the side of the prism and looking toward the transparent side sees only one object.

The terms *contraplex* and *diplex* are here applied as specific names for designating clearly the way in which the particular simultaneous double transmission to which we wish to refer is effected. Thus, for instance, two messages may be sent over a single wire in the same or in opposite directions, and when we do not care to particularize either, we simply allude to them under the more common generic name of *diplex* transmission, which includes both. When, however, we wish to speak of either method by itself, we use the term *diplex* for simultaneous transmission in the same direction, and *contraplex* for that in opposite directions.

ratodus (*Monopneumona*), and many extinct relatives. They have both branchial and pulmonary respiration, whence the name; no distinct suspensorium is developed, but the lower jaw articulates directly with descending processes of the cranium: there is a median pelvic element; and the limbs are multiaarticulate. The skeleton is partially osseous, with persistent notochord; the heart has two auricles and one ventricle; there is a muscular conus arteriosus and spiral intestinal valve; the gills are free, with a narrow opening and rudimentary gill-cover; and the air-bladder is nearly or quite double, and developed into functional lungs permanently communicating with the esophagus. The body is covered with cycloid scales. The living *Dipnoi* are divisible into two groups, *Dipneumona* with paired lungs, and *Monopneumona* with a single lung and two symmetrical halves. Some old extinct relations are referred to another order (or suborder) called *Ctenodipterini*, by others endowed with the rank of a family only. See *barranunda*, *Ceratodidae*, *Ctenodipterini*, *Dipteridae*, *Lepidosirenidae*, mudfish, and *Sirenioidea*. Also called *Diplognoi*, *Dipneusta*, *Dipneusti*, *Dipnoa*.

It is a remarkable circumstance, that while the *Dipnoi* present in so many respects a transition between the piscine and the amphibian types of structure, the spinal column and the limbs should be not only piscine, but more nearly related to those of the most ancient Crossopterygian Ganoids than to those of any other fishes. Huxley, *Anat. Vert.*, p. 148.

Diptera (dip'te-ră), *n. pl.* [NL., neut. pl. of *dipterus*, two-winged: see *dipteros*.] 1. An order of metachelate hexapod insects. They are two-winged insects, or flies, with two membranous wings with radiating nervures, not folded at rest, a posterior pair being only represented by halteres or poisers; no mandibles as such, but a suctorial proboscis instead, formed of modified mandibles, maxillæ, and the central labium, here called glossarium; usually two maxillary but no labial palpi; antennæ generally short; two large compound eyes, often of thousands of facets, and three ocelli or simple eyes; and the prothorax and metathorax reduced, the mesothorax being correspondingly developed. Metamorphosis is complete; the larvae are apodal, or with only rudimentary feet; the pupæ are usually corcate (see cut under *coarctate*), sometimes obteated. The common house-fly, blue-bottle, etc., are characteristic examples. The power which many of these insects have of walking on smooth surfaces with back downward is due to the construction of the feet, which act as suckers. They have, besides the ordinary two claws, several little cushions called pulvilli, beset with fine hairs expanded at their tips into a kind of disk; the adhesion is aided in some cases by a viscid secretion of these hairs. The order is a very large one: there are said to be 9,000 European species alone, supposed to be not a twentieth part of the whole number. About 4,000 are described as North American. A few are useful scavengers, but many are injurious insects, and some are great pests. Gnats, mosquitos, gad-flies, blow-flies, bot-flies, tsetzes, etc., belong to this order. It is variously subdivided, one division being into four suborders: the *Pupipara*, which are parasitic, and developed in the body of the parent, as the bee-lice; the *Brachycera*, or ordinary flies; the *Nemocera*, or crane-flies, gnats, midges, mosquitos, etc.; and the wingless *Aphaniptera*, or fleas, which are often ranked as a

distinct order. Another division is into the suborders *Orthorhapha* and *Cyclorhapha*, according to the character of the metamorphosis: the former with two sections, *Nematocera* and *Brachycera*; the latter with also two sections, *Aschiza* and *Schizophora*.

(c) The intercessions in the course of which these names were introduced. The recitation of the name of any prelate or civil ruler in the diptychs was a recognition of his orthodoxy; its omission, the reverse. The mention of a person after death recognized him as having died in the communion of the church, and the introduction of his name into the list of saints or martyrs constituted canonization. In liturgies the diptychs are distinguished as the *diptychs of the living* and the *diptychs of the dead*, the latter including also the commemoration of the saints. In most liturgies the diptychs are included in the *great intercession* (see *intercession*). direct-action (di-*rek't*'ak'shən), *a.* In mech., characterized by direct action: a term applied to engines which have the piston-rod or cross-head connected directly to, or by a connecting-rod with, the crank, dispensing with working-beams and side levers: as, a direct-action steam-engine. A rectilinear motion of the piston is insured by a cross-head at the end of the piston-rod, which slides in parallel guides, or, in the case of the oscillating engine, the cylinder vibrates in accordance with the movement of the crank. Special types of direct-action engines are the annular double-cylinder, double-piston, inclined-cylinder, inverted-cylinder, oscillating, sliding-cover, steeple, and trunk-engines. Also applied to steam-pumps which have the steam-piston connected by the piston-rod directly to the pump-piston or plunger, and which have valve-gear that prevents stopping on what is called the dead-center. Such pumps work without cranks or fly-wheels.

Sw. direction*, < *L. directio(n)*], a making straight, a straight line, a directing (toward anything), < *dirigere*, pp. *directus*, direct: see *direct*.] 1. Relative position considered without regard to linear distance. The direction of a point, A, from another point, B, is or is not the same as the direction of a point, C, from another point, D, according as a straight line drawn from B through A and continued to infinity would or would not cut the celestial sphere at the same point as a straight line drawn from D through C and also continued to infinity. Every motion of a point has a determinate direction; for if any motion from any instant were to lose all curvature, it would tend toward a determinate point of the celestial sphere, which would define its direction at the instant when it ceased to be deflected. It is inaccurate to say that a line has a determinate direction, because a motion along that line has either one of two opposite directions. Yet the word direction is sometimes used in a loose sense in which, opposite directions not being distinguished, the direction of a line is spoken of, meaning the pair of opposite directions.

The direction of a star is seen at a glance, while the most profound science and the most accurate observations have not enabled the astronomer to ascertain its distance.

B. Peirce.

directly (di-*rek'tli*), *adv.* 1. In a straight line or course, literally or figuratively; in the natural and primitive way: as, aim directly at the object; gravity tends directly to the center of the earth. In mechanics a body is said to strike or impinge directly against another when the stroke is in a direction perpendicular to the surface at the point of contact. Also, a sphere is said to strike directly against another when the line of direction passes through both their centers. The principal ecclesiastical directories are: (1) The set of rules drawn up in 1644 by the Westminster Assembly of Divines, to take the place of the Book of Common Prayer of the Church of England, ratified by Parliament in 1645, and adopted by the Scottish General Assembly the same year. (2) In the *Rom. Cath. Ch.*, a list, drawn up by authority of the bishop, containing directions as to the mass and office to be said on each day of the year. The number of feasts in the present calendar, and the frequent necessity of transferring some, commemorating or omitting others, makes the Directorium (or, as it is usually called, the *Ordo*) necessary for the clergy.
